The exclamation point in an equilateral triangle is intended to alert the user to the presence of important operating and maintenance (servicing) instructions in the literature accompanying the product.

IMPORTANT SAFETY INSTRUCTIONS

When installing telephone equipment, basic safety precautions should always be followed to reduce the risk of fire, electric shock, and injury to persons, including:

- Read and understand all instructions.
- Follow all warnings and instructions marked on or packed with the product.
- Never install telephone wiring during a lightning storm.
- Never install telephone jacks in a wet location unless the jack is specifically designed for wet locations.
- Never touch uninsulated telephone wires or terminals unless the telephone wiring has been disconnected at the network interface.
- Use caution when installing or modifying telephone lines.
- Use only AT&T-manufactured MERLIN LEGEND™ circuit modules, carrier assemblies, and power units in the MERLIN LEGEND (511A) control unit.
- Use only AT&T - recommended/approved MERLIN LEGEND accessories.
- If equipment connected to the analog station modules (008/408/408 GS/LS) or to the MLX telephone module (008 MLX) is to be used for in-range out-of-building (IROB) applications, IROB protectors are required.
- Do not install this product near water, for example, in a wet basement location.
- Do not overload wall outlets as this can result in the risk of fire or electric shock.
- The MERLIN LEGEND is equipped with a three-wire grounding-type plug, a plug having a third (grounding) pin. This plug will fit only into a grounding-type power outlet. This is a safety feature. If you are unable to insert the plug into the outlet, contact an electrician to replace the obsolete outlet. Do not defeat the safety purpose of the grounding plug.
- The MERLIN LEGEND system requires a supplementary ground.
- Do not attach the power supply cord to building surfaces. Do not allow anything to rest on the power cord. Do not locate this product where the cord will be abused by persons walking on it.
- Slots and openings in the module housings are provided for ventilation. To protect this equipment from overheating, do not block these openings.
- Never push objects of any kind into this product through module openings or expansion slots, as they may touch dangerous voltage points or short-out parts, which could result in a risk of fire or electric shock. Never spill liquid of any kind on this product.
- Unplug this product from the wall outlet before cleaning. Do not use liquid or aerosol cleaners on this product. Use a damp cloth for cleaning.

Customer Support Information

Support Telephone Number

AT&T provides a toll-free customer Helpline (1-800-628-2888) 24 hours a day (U.S.A. only). Call the Helpline, or your authorized dealer, if you need assistance when installing, programming, or using your system.

Federal Communications Commission (FCC) Electromagnetic Interference Information

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at his own expense.

Canadian Department of Communications (DOC) Interference Information

This digital apparatus does not exceed the Class A limits for radio noise emissions set out in the radio interference regulations of the Canadian Department of Communications.

Le présent appareil numérique n'émet pas de bruits radioélectriques dépassant les limites applicables aux appareils numériques de la classe A prescrites dans le Règlement sur le brouillage radioélectrique édicté par le ministère des Communications du Canada.

FCC Notification and Repair Information

This equipment is registered with the FCC in accordance with Part 68 of its rules. In compliance with those rules, you are advised of the following:

- **Means of Connection.** Connection of this equipment to the telephone network shall be through a standard network interface jack: USOC RJ11C, RJ14C, RJ21X. Connection to E&M tie trunks requires a USOC RJ2GX. Connection to off-premises stations requires a USOC RJ11C or RJ14C. Connection to 1.544 Mbs digital facilities must be through a USOC RJ48C or RJ48X. Connection to DID requires a RJ11C, RJ14C or RJ21X. These USOCs must be ordered from your telephone company.

This equipment may not be used with party lines or coin telephone lines.

- **Notification to the Telephone Companies.** Before connecting this equipment, you or your equipment supplier must notify your local telephone company's business office of the following:

- The telephone number(s) you will be using with this equipment.
- The appropriate registration number and ringer equivalence number (REN), which can be found on the back or bottom of the control unit, is as follows:

If this equipment is to be used as Key System, report the following number AS593M-72914-KF-E, and if the system provides both manual and automatic selection of incoming/outgoing access to the network, report AS593M-72682-MF-E. The ringer equivalence number for both systems is 1.5A.

- For tie line connection, provide the telephone company the facility interface code (FIC) of TL31M and the service order code (SOC) 9.0F.

- For connection to off-premises stations, report the FIC OL13C and SOC 9. OF.
- If this equipment is to be connected to digital service (1.544 Mbs), the FIC is 04DU9-B for D4 framing format or 04DU9-C for extended framing format, and SOC 6.0P.
- If this equipment is to be connected to DID facilities, the FIC is 02 RV2-T, and the SOC is 9.0F.
- The quantities and USOC numbers of the jacks required.
- For each jack, provide the sequence in which lines are to be connected: the type lines, the FIC, and REN by position when applicable.

You must also notify your local telephone company if and when this equipment is permanently disconnected from the line(s).

The REN is used to determine the quantity of devices which maybe connected to the telephone line. Excessive RENs on the telephone line may result in the devices not ringing in response to an incoming call. In most, but not all, areas the sum of the RENs should not exceed five (5.0). To be certain of the number of devices that may be connected to the line, as determined by the total RENs, contact the telephone company to determine the maximum REN for the calling area.

Installation and Operational Procedures

The manuals for your system contain information about installation and operational procedures.

- **Repair Instructions.** If you experience trouble because your equipment is malfunctioning, the FCC requires that the equipment not be used and that it be disconnected from the network until the problem has been corrected. Repairs to this equipment can be made only by the manufacturers, their authorized agents, or by others who may be authorized by the FCC. In the event repairs are needed on this equipment, please contact the National Service Assistance Center (NSAC) at 1-800-628-2888, or your authorized AT&T dealer.
- **Rights of the Local Telephone Company.** If this equipment causes harm to the telephone network, the local telephone company may discontinue your service temporarily. If possible, they will notify you in advance. But if advance notice is not practical, you will be notified as soon as possible. You will also be informed of your right to file a complaint with the FCC.

Your local telephone company may make changes in its facilities, equipment, operations, or procedures that affect the proper functioning of this equipment. If they do, you will be notified in advance to give you an opportunity to maintain uninterrupted telephone service.
- **Hearing Aid Compatibility.** The custom telephone sets for this system are compatible with inductively coupled hearing aids as prescribed by the FCC.
- **Automatic Dialers.** WHEN PROGRAMMING EMERGENCY NUMBERS AND/OR MAKING TEST CALLS TO EMERGENCY NUMBERS:
 - Remain on the line and briefly explain to the dispatcher the reason for the call.
 - Perform such activities in the off-peak hours, such as early morning or late evening.

DOC Notification and Repair Information

NOTICE: The Canadian Department of Communications (DOC) label identifies certified equipment. This certification means that the equipment meets certain telecommunications network protective, operational, and safety requirements. The DOC does not guarantee the equipment will operate to the user's satisfaction.

Before installing this equipment, users should ensure that it is permissible to connect it to the facilities of the local telecommunications company. The equipment must also be installed using an acceptable method of connection. In some cases, the company's inside wiring for single-line individual service may be extended by means of a certified connector assembly (telephone extension cord). The customer should be aware that compliance with the above conditions may not prevent degradation of service in some situations.

Repairs to certified equipment should be made by an authorized Canadian maintenance facility designated by the supplier. Any repairs or alterations made by the user to this equipment, or any equipment malfunctions, may give the telecommunications company cause to request the user to disconnect the equipment.

Users should ensure for their own protection that the electrical ground connections of the power utility, telephone lines, and internal metallic water pipe system, if present, are connected. This precaution may be particularly important in rural areas.

CAUTION: Users should not attempt to make such connections themselves, but should contact the appropriate electric inspection authority or electrician, as appropriate.

To prevent overloading, the **Load Number** (LN) assigned to each terminal device denotes the percentage of the total load to be connected to a telephone loop used by the device. The termination on a loop may consist of any combination of devices subject only to the requirement that the total of the Load Numbers of all the devices does not exceed 100.

DOC Certification No. 230 4095A

CSA Certification No. LR 56260

Load No. 6

Renseignements sur la notification du ministère des Communications du Canada et la réparation

AVIS: L'étiquette du ministère des Communications du Canada identifie le matériel homologué. Cette étiquette certifie que le matériel est conforme à certaines normes de protection, d'exploitation et de sécurité des réseaux de télécommunications. Le ministère n'assure toutefois pas que le matériel fonctionnera à la satisfaction de l'utilisateur.

Avant d'installer ce matériel, l'utilisateur doit s'assurer qu'il est permis de le raccorder aux installations de l'entreprise locale de télécommunication. Le matériel doit également être installé en suivant une méthode acceptée de raccordement. Dans certains cas, les fils intérieurs de l'entreprise utilisés pour un service individuel à ligne unique peuvent être prolongés au moyen d'un dispositif homologué de raccordement (cordon prolongateur téléphonique interne). L'abonné ne doit pas oublier qu'il est possible que la conformité aux conditions énoncées ci-dessus n'empêchent pas la dégradation du service dans certaines situations. Actuellement, les entreprises de télécommunication ne permettent pas que l'on raccorde leur matériel à des jacks d'abonné, sauf dans les cas précis prévus par les tarifs particuliers de ces entreprises.

Les réparations de matériel homologué doivent être effectuées par un centre d'entretien canadien autorisé désigné par le fournisseur. La compagnie de télécommunications peut demander à l'utilisateur de débrancher un appareil à la suite de réparations ou de modifications effectuées par l'utilisateur ou à cause de mauvais fonctionnement.

Pour sa propre protection, l'utilisateur doit s'assurer que tous les fils de mise à la terre de la source d'énergie électrique, des lignes téléphoniques et des canalisations d'eau métalliques, s'il y en a, sont raccordés ensemble. Cette précaution est particulièrement importante dans les régions rurales.

AVERTISSEMENT: L'utilisateur ne doit pas tenter de faire ces raccordements lui-même; il doit avoir recours à un service d'inspection des installations électriques, ou à un électricien, selon le cas.

L'indice de charge (IC) assigné à chaque dispositif terminal indique, pour éviter toute surcharge, le pourcentage de la charge totale qui peut être raccordée à un circuit téléphonique bouclé utilisé par ce dispositif. La terminaison du circuit bouclé peut être constituée de n'importe quelle combinaison de dispositifs, pourvu que la somme des indices de charge de l'ensemble des dispositifs ne dépasse pas 100.

No d'homologation 230 4095A

Node certification CSA: LR 56260

MERLIN LEGEND™

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Model 511A Control Unit

Complies with Part 68, FCC Rules, FCC Reg. No. AS593M-72682-MF-E, Ringer Equivalence 1.5A. When equipped with the "KF" option (key only), FCC Reg. No. AS593M-72914-KF-E, Ringer Equivalence 1.5A.

MADE IN USA

TELEPHONE
EQUIPMENT

LR 56260

Use only AT&T manufactured MERLIN LEGEND circuit modules, carrier assemblies, and power units, as specified in the Installation Manual, in this product. There are no user serviceable parts inside. Contact your authorized agent for service and repair. This digital apparatus does not exceed the Class A limits for radio noise emissions set out in the radio interference regulations of the Canadian Department of Communications.

Le présent appareil numérique n'émet pas de bruits radioélectriques dépassant les limites applicables aux appareils numériques de la classe A prescrites dans le Règlement sur le brouillage radioélectrique édicté par le ministère des Communications du Canada.

WARNING: If equipment is used for out-of-building applications, approved secondary protectors are required. See Installation Manual.

AVERTISSEMENT: Si l'équipement est utilisé pour des applications extérieures, l'installation d'un protecteur secondaire est requise. Voir le manuel d'installation.

Security of Your System—Preventing Toll Fraud

As a customer of a new telephone system, you should be aware that there exists an increasing problem of telephone toll fraud. Telephone toll fraud can occur in many forms, despite the numerous efforts of telephone companies and telephone equipment manufacturers to control it. Some individuals use electronic devices to prevent or falsify records of these calls. Others charge calls to someone else's number by illegally using lost or stolen calling cards, billing innocent parties, clipping on to someone else's line, and breaking into someone else's telephone equipment physically or electronically. In certain instances, unauthorized individuals make connections to the telephone network through the use of remote access features.

The Remote Access feature of your system, if you choose to utilize it, permits off-premises callers to access the system from a remote telephone by using an 800 number or a 7- or 10- digit telephone number. The system returns an acknowledgement signaling the user to key in his or her authorization code, which is selected and administered by the system manager. After the authorization code is accepted, the system returns dial tone to the user. If you do not program specific egress restrictions, the user will be able to place any call normally dialed from a telephone associated with the system. Such an off-premises network call is originated at, and will be billed from, the system location.

The Remote Access feature, as designed, helps the customer, through proper administration, to minimize the ability of unauthorized persons to gain access to the network. Most commonly, phone numbers and codes are compromised when overheard in a public location, through theft of a wallet or purse containing access information, or through carelessness (writing codes on a piece of paper and improperly discarding it). Additionally, hackers may use a computer to 'dial' an access code and then publish the information to other hackers. Enormous charges can be run up quickly. It is the customer's responsibility to take the appropriate steps to properly implement the features, evaluate and administer the various restriction levels, protect access codes, and distribute access codes only to individuals who have been fully advised of the sensitive nature of the access information.

Common carriers are required by law to collect their tariffed charges. While these charges are fraudulent charges made by persons with criminal intent, applicable tariffs state that the customer of record is responsible for payment of all long-distance or other network charges. AT&T cannot be responsible for such charges and will not make any allowance or give any credit for charges that result from unauthorized access.

To minimize the risk of unauthorized access to your communications system:

- Use a nonpublished Remote Access number.
- Assign authorization codes randomly to users on a "need-to-have" basis, keeping a log of ALL authorized users and assigning one code to one person.
- Use random sequence authorization codes, which are less likely to be easily broken.
- Deactivate all unassigned codes promptly.
- Ensure that Remote Access users are aware of their responsibility to keep the telephone number and any authorization codes secure.
- When possible, restrict the off-network capability of off-premises callers, via use of Call Restrictions and Disallowed List capabilities.
- When possible, block out-of-hours calling.
- Frequently monitor system call detail reports for quicker detection of any unauthorized or abnormal calling patterns.
- Limit Remote Call Forward to persons on a "need-to-have" basis.

Limited Warranty and Limitation of Liability

Limited Warranty

AT&T warrants to you, the customer, that your MERLIN LEGEND Communications System will be in good working order on the date AT&T or its authorized reseller delivers or installs the system, whichever is later ("Warranty Date"). If you notify AT&T or its authorized reseller within one year of the Warranty Date that your system is not in good working order, AT&T will without charge to you repair or replace, at its option, the system components that are not in good working order. Repair or replacement parts may be new or refurbished and will be provided on an exchange basis. If AT&T determines that your system cannot be repaired or replaced, AT&T will remove the system and, at your option, refund the purchase price of your system, or apply the purchase price towards the purchase of another AT&T system.

If you purchased your system directly from AT&T, AT&T will perform warranty repair in accordance with the terms and conditions of the specific type of AT&T maintenance coverage you selected. A written explanation of AT&T's types of maintenance coverage may be obtained from AT&T by calling 1-800-247-7000. If you purchased your system from an AT&T authorized reseller, contact your reseller for the details of the maintenance plan applicable to your system.

This AT&T limited warranty covers damage to the system caused by power surges; including power surges due to lightning.

The following will not be deemed to impair the good working order of the system, and AT&T will not be responsible under this limited warranty for damages resulting from

- failure to follow AT&T's installation, operation, or maintenance instructions
- unauthorized system modification, movement, or alteration
- unauthorized use of common carrier communication services accessed through the system
- abuse, misuse, or negligent acts or omissions of the customer and persons under the customer's control
- acts of third parties and acts of God

AT&T'S OBLIGATION TO REPAIR, REPLACE, OR REFUND AS SET FORTH ABOVE IS YOUR EXCLUSIVE REMEDY.

EXCEPT AS SPECIFICALLY SET FORTH ABOVE, AT&T, ITS AFFILIATES, SUPPLIERS, AND AUTHORIZED RESELLERS MAKE NO WARRANTIES, EXPRESS OR IMPLIED, AND SPECIFICALLY DISCLAIM ANY WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

LIMITATION OF LIABILITY

EXCEPT FOR PERSONAL INJURY, DIRECT DAMAGES TO TANGIBLE PERSONAL PROPERTY PROXIMATELY CAUSED BY AT&T, AND LIABILITY OTHERWISE EXPRESSLY ASSUMED IN A WRITTEN AGREEMENT SIGNED BY AT&T, THE LIABILITY OF AT&T, ITS AFFILIATES, SUPPLIERS AND AUTHORIZED RESELLERS FOR ANY CLAIMS, LOSSES, DAMAGES OR EXPENSES FROM ANY CAUSE WHATSOEVER (INCLUDING ACTS OR OMISSIONS OF THIRD PARTIES) REGARDLESS OF THE FORM OF ACTION, WHETHER IN CONTRACT, TORT OR OTHERWISE, SHALL NOT EXCEED AN AMOUNT EQUAL TO THE LESSER OF THE DIRECT DAMAGES PROVEN OR THE PURCHASE PRICE OF THE SYSTEM. IN NO EVENT SHALL AT&T OR ITS AFFILIATES, SUPPLIERS OR AUTHORIZED RESELLERS BE LIABLE FOR INCIDENTAL, RELIANCE, CONSEQUENTLY, OR ANY OTHER INDIRECT LOSS OR DAMAGE (INCLUDING LOST PROFITS OR REVENUES) INCURRED IN CONNECTION WITH THE SYSTEM. THIS LIMITATION OF LIABILITY SHALL SURVIVE FAILURE OF THE EXCLUSIVE REMEDY SET FORTH IN THE LIMITED WARRANTY ABOVE.

About This Book

This book tells you how to plan a Key or Behind Switch communications system. It is intended for persons who plan, implement, coordinate, and manage the system (called "system managers").

In addition to this book, you will need

- copies of the Key System Planning Forms

You will use these forms to

- outline the decisions you make about how the system should be assembled and programmed—for example, what trunks will be connected to the control unit and in what order.
- program the system following the form information. These forms are formatted to reflect the order, or sequence, of programming and include the category and entry titles found on the programming screens.
- create an external record of your system's configuration—its equipment, options, and features.
- the AT&T list of equipment ordered for the system
- the local telephone company's and long-distance vendor's line information lists
- copies of the Employee Communication Survey form
- a floor plan showing the locations of the equipment

Related Documentation

The following types of books are available to help you set up, use, and maintain the communications system:

- reference
- setup and modification
- telephone user support
- operator guides
- miscellaneous

How to Order Books

The books needed for operating the communications system were supplied with the system. You can order additional copies of these and other books listed below from the AT&T Customer Information Center:

- Within the continental United States, call 1-800-432-6600.
- In Canada, call 1-800-255-1242.

Additional Ordering Information

For information on ordering replacement parts, accessories, and other equipment that is compatible with the system, see Appendix A in *System Reference*.

Product Safety Labels

Throughout this book, hazardous situations are indicated by an exclamation point inside a triangle, along with the word caution or warning:

 **WARNING**

Warning indicates the presence of a hazard that could cause death or severe personal injury if the hazard is not avoided.

 **CAUTION**

Caution indicates the presence of a hazard that will or can cause minor personal injury or property damage if the hazard is not avoided.

How to Comment on This Book

We welcome your feedback on this book. Please use the feedback form that follows. If the form is missing, send your comments to A. Sherwood, AT&T, 99 Jefferson Road, Rm. #2A25, Parsippany, NJ 07054.

Preparation

1

Several actions must be completed before the system is installed:

- Review the system's hardware, features, and operation.
- Arrange for the location of the control unit.
- Survey telephone users on their needs.
- Find or create a floor plan.

System Components

To tailor the system for your company, you must know the number and types of telephones, outside lines, and adjuncts that were ordered. Review the AT&T Equipment List provided by your AT&T representative or authorized dealer.

If you did not participate in ordering, talk with your management about how the equipment ordered will be used—for example, which employees will get what telephones, which consoles operators will be using, and where adjuncts will be located.

Figure 1-1 shows the components of a typical system. Your system may not have all the components pictured, or it may have additional or different components. The numbered items in the figure correspond to the descriptions that follow.

Figure 1-1 System Components

1-2 System Components

1. **Control Unit** The backbone of the system, consisting of the basic and expansion carriers, power supply module, processor module, and line and station modules. The control unit connects telephone company lines with stations such as telephones and adjuncts.
2. **Line/Trunk and Station Modules.** The components that connect telephone company lines and terminal equipment such as telephones, external alerts, and fax machines via jacks to the control unit.
3. **Basic Carrier.** The component attached to the backboard used to hold the modules needed for system operation. The basic carrier houses the processor module, power supply module, and up to five line and station modules. Each expansion carrier houses its own power supply module and up to six additional line and/or station modules. One or two expansion carriers can be added.
4. **Processor Module.** A miniature computer that controls most of the system's features and supplies the system's diagnostics. The processor module provides two jacks, one for Station Message Detail Recording (SMDR) and the other for system programming and maintenance via a personal computer (PC).
5. **Power Supply Module.** The component that supplies DC power for the modules and telephones (one power supply unit is needed per carrier). If the system's power requirements exceed the capacity of the power supply module, an auxiliary power supply unit can be added.
6. **MLX-20L Telephone with Direct Station Selector (DSS).** A console that adds 50 buttons for one-touch extension dialing to the MLX-20L™ or MLX-28D™ telephone and speeds call handling.
7. **Analog Data Terminal.** A data terminal such as a PC, printer, or optical reader that connects via a modem (for transmitting and receiving analog signals) to a 012 basic telephone module or a 008 OPT module. A data terminal can also be connected to an MIX telephone using a Multi-Function Module (MFM) or to an analog multiline telephone using a General Purpose Adapter (GPA.)
8. **Magic on Hold®.** Optional equipment that connects to the system through a GS/LS jack programmed for Music-on-Hold. (A customer-provided music source can be connected instead of Magic on Hold.)
9. **General Purpose Adapter (GPA).** An adapter used to connect a variety of tip/ring (T/R) adjuncts to an analog multiline telephone (shown here with an answering machine).
10. **Analog Multiline Telephone.** A 34-button telephone with built-in speakerphone that connects to the system via an analog station jack. Other analog multiline telephones compatible with the system include the 22- and 34-button with built-in speakerphone and a one-line, 16-character display and the 10- and 22-button with built-in speakerphone, without display.
11. **MLC-5 Cordless Telephone.** A cordless multiline telephone that connects to the control unit via an analog station jack.
12. **Single-Line Telephone.** A touch-tone or rotary industry-standard telephone connected to the system via a 012 basic telephone module or a 008 OPT module.

13. **Off-Premises Telephone (OPT).** A single-line, touch-tone or rotary, industry-standard telephone located in a different building from the control unit.
14. **External Alert.** An alerting device such as bells, chimes, and strobe lights that connect to a jack on a 012 basic telephone module or a 008 OPT module, or to an MFM or Supplemental Alert Adapter (SAA).
15. **Digital Data Terminal.** A data terminal such as a PC, printer, or optical reader that connects via an ISDN 7500B Data Module to a 008 MLX module and that can also include an MDX telephone.
16. **MLX-20L™ Telephone.** A digital/ISDN (MLX) telephone with 20 line buttons and a display with seven lines of 24 characters each. The MLX-20L telephone can also be used as a system programming console. Other MLX telephones include:
 - **MLX-10™/MLX-10D™ Telephone.** A 10-button MLX telephone with or without a two-line, 24-character display,
 - **MIX-28D™ Telephone.** An MLX telephone with 28 line buttons and a two-line, 24-character display.
17. **MLX-28D Telephone with Multi-Function Module (MFM).** A circuit board mounted inside an MLX telephone that provides a jack to connect equipment such as answering machines, fax machines, external alerts, and modems to the telephone.
18. **Fax Machine.** Industry-standard fax machines connected to the control unit via a jack on a 012 basic telephone module or a 008 OPT module, an MFM, or a GPA.
19. **SMDR Printer.** A printer for Station Message Detail Recording (SMDR) call records, connected via an RS-232 jack on the processor module.
20. **Applications.** Software and hardware for MERLIN LEGEND™ Communications System that can connect to the control unit to provide more functions:
 - Call Accounting System (CAS)
 - Call Accounting Terminal (CAT)
 - Call Management System (CMS)
 - MERLIN MAIL™ Voice Messaging System
 - MERLIN® Attendant
 - Integrated Solution II (IS II)
 - Call Accounting System (CAS) — IS II
 - AUDIX® Voice Power — IS II
 - Integrated Voice Power Automated Attendant — IS II
 - MERLIN LEGEND™ System Programming and Maintenance (SPM)
21. **Loudspeaker Paging System.** A single-zone or multizone system such as PagePac* with Zonemate†9 or 39 that connects via an administered jack on a GS/LS module.
22. **AC Power Outlet.** A dedicated 115-VAC wall outlet (not controlled by an on/off switch) that supplies power to the control unit.

* PagePac is a registered trademark of Dracon, a division of Harris Corporation.

† Zonemate is a trademark of Dracon, a division of Harris Corporation.

Location of the Control Unit

Before installation, choose a room, closet, or other area where the system control unit can be mounted on the wall. The area must meet the environmental requirements in Table 1-1.

Table 1-1 Environmental Requirements

Distances	<ul style="list-style-type: none"> ■ Within 25 feet of the network interface (cannot be installed outdoors) ■ Within 1000 feet of telephones ■ Within 5 feet of a dedicated AC power outlet (1 plug per carrier)
Heat Dissipation	<ul style="list-style-type: none"> ■ Fully loaded basic carrier: 500 Btu/hr ■ Fully loaded 2-carrier: 1000 Btu/hr ■ Fully loaded 3-carrier: 1500 Btu/hr
Power Requirements	<ul style="list-style-type: none"> ■ Basic carrier: 117 VAC 60 Hz \pm 1% 160 W 3 amps ■ 2-carrier: 117 VAC 60 Hz \pm 1% 320 W 6 amps ■ 3-carrier: 117 VAC60HZ \pm 1% 480 W 9 amps ■ 1 properly grounded plug needed per carrier ■ Additional outlets if installing printers and PCs
Temperature	40°-104°F; 4°-40°C (optimum temperature 60°F, 16°C)
Humidity	20% - 80% relative humidity
Ventilation	<ul style="list-style-type: none"> ■ Allow at least 1 inch of space on the right and left sides of the control unit and 12 inches above and below the control unit to prevent overheating.

Continued

Table 1-1 Continued

Cautions	<ul style="list-style-type: none"> ■ The AC outlet for control unit should not be switch controlled. ■ Plugging the control unit into an outlet that can be turned on and off by a switch can cause accidental disconnection of the system. ■ The AC outlet must be properly grounded via an AC receptacle for a 3-prong plug. ■ Do not install the control unit outdoors. ■ Do not place the control unit near extreme heat (furnaces, heaters, attics, or direct sunlight). ■ Do not expose the control unit to devices that generate electrical interference (such as arc welders or motors). ■ Each auxiliary power unit requires 1 outlet. ■ Do not expose the control unit to moisture, corrosive gases, dust, chemicals, spray paint, or similar materials. ■ Do not place anything on top of the carriers. ■ Do not install under any device that may drip fluid, such as an air conditioner.
----------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

In addition, a 3/4-inch plywood backboard is needed to mount the system on the wall. The dimensions depend on the number of carriers, as shown in Table 1-2. In some areas, fire or electrical codes require a flame retardant backboard. Check with the appropriate authorities to ensure that the proper material is provided.

Table 1-2 Control Unit Space Requirements

Carrier	Dimensions
Basic carrier	14"w x 23"h x 12"d
Basic carrier + 1 expansion carrier	25"w x 23"h x 12"d
Basic carrier + 2 expansion carriers	37"w x 23"h x 12"d
Backboard	Dimensions
Small system (minimum needed)	4'w x 3'h x 3/4"d
Large system (minimum needed)	6'w x 3'h x 3/4"d

It is important that the location you select for the control unit meets all of these specifications and that the backboard is in place before installation. If you've already selected a location and changes are needed, arrange for these changes as soon as possible before installation.

1-6 Location of the Control Unit

Telephone User Survey

The features and calling privileges you assign to each employee's telephone ensure that employees get the most benefit from the system.

If you were not involved in the planning and decision-making for the system, find out from your management and your AT&T representative or authorized dealer what telecommunications needs were identified.

To determine calling privileges, get answers to the following questions:

- Does management want to allow both local and toll calls to be made from every telephone?
- If any telephones are restricted, are there any numbers the users should be allowed to call?
- Are there any specific numbers (such as 900) that you want to restrict users from calling?
- Who, if anyone, will be given personal lines?
- Will access to central office lines be restricted to certain employees?
- Do any departments receive frequent special calls (such as sales and service) so that calls should come to them directly, bypassing a system operator?

Use the Employee Communication Survey form (see Figure 1-2) to determine each employee's telecommunications needs. If it is not feasible to have each employee fill out a form, get the information you need from a knowledgeable person in each department, section, or work group. This person should have sufficient information and authority to make decisions about calling features and coverage assignments for others in the department.

Make the appropriate number of copies of the Employee Communication Survey form.

Name _____ Room _____ Extension _____

Name of work group (Sales, Customer Service) _____

Please answer each question below.

1. Do you regularly use any of the following outside lines? (Check any that apply)
 - WATS
 - FX (foreign exchange)
 - Tie
 - None of the above or don't know
2. Are your phone calls covered when you're away from your desk?
 - No
 - Yes By whom? _____
3. Do you cover phone calls for co-workers when they are away from their desks?
 - No
 - Yes For whom? _____

Which of those people should have a button on your phone used exclusively for his or her calls?

When you are unable to cover calls, it is done by _____

4. Do you share the incoming call workload with others?
 - No
 - Yes With whom? _____
5. Would you say your phone use is
 - Heavy
 - Average
 - Light

Figure 1-2 Employee Communication Survey Form

6. Do you have a data terminal or personal computer at your workstation?

No Do you expect to get one within the next year?

No

Yes

Yes Do you have a modem or ISDN 7500B Data Module?

No

Yes

7. Do you use account codes for charge-back of calls?

No

Yes Please list all the codes you use (attach another sheet if necessary):

8. Approximately how many times do you transfer calls? _____ times/day

9. Do you need to dial the same number over and over every day?

No

Yes Please list these numbers:

10. Do you want to be able to pick up other people's calls when you hear their phones ring?

No

Yes Please list these people:

11. Do you want your phone number to appear on another person's phone for screening, or covering calls, or for other reasons?

No

Yes Please list these people:

Figure 1-2 Continued

Use the information in Table 1-3 to interpret and analyze the results of the Employee Communication Survey.

Table 1-3 Employee Communication Survey — Sample Analysis

1. Types of lines used	Indicates toll calling habits. In most cases, assigning a button for each line is not necessary.
2. Calls covered by someone else (sender)	Suggests that this employee should be assigned as a sender in either Individual or Group Coverage arrangement, particularly if calls are covered by someone other than the operator.
3. Cover someone else's calls (receiver)	Suggests assignment as a receiver in either Individual or Group Coverage arrangements.
4. Share incoming calls	Identifies calling group needs.
5. Frequency of use	Identifies heavy and light telephone users. Heavy users may benefit from additional line buttons.
6. Data needs	Identifies existing and potential data terminal and personal computer users. See the <i>Data Guide</i> .
7. Use of account codes	Identifies current account codes used for charge-back of calls.
8. Frequency of transfers	Suggests the need for one-touch transfer.
9. Frequently dialed numbers	Identifies useful numbers for the System Speed Dial list.
10. Picking up calls	Identifies need for a pickup group.
11. Sharing lines/telephone numbers	Identifies common personal line appearances.

Floor Plan

Use a floor plan to make planning more manageable and to ensure that the correct telephone equipment is assigned to each employee.

If your organization is moving to a new location, a floor plan may already be prepared and you may be able to get a copy of it from your management.

Create a floor plan in two phases:

1. Indicate the location and type of telephones, adjuncts (fax, answering machines, etc.), and data terminals.
2. When you assign extension numbers, indicate the assigned numbers on the floor plan.

Note: In this book, telephones and associated adjuncts, such as answering machines or data terminals, or adjuncts connected directly to the control unit, are called 'stations.'

Planning Instructions:

1. Use a large sheet of paper and sketch your office layout. The location of office walls and other partitions is important when features are assigned to telephones that must be within hearing range of each other. For example pickup group members must be able to hear each others' telephones ringing.
2. Indicate the location of each employee's telephone, other locations where there will be a telephone (such as in a conference room), and the locations of data terminals, PCs, and host computers. Use the symbols shown in figure 1-3.
3. Indicate the type of telephone at each location, using an abbreviation that includes the number of programmable buttons. For example, write "MLX-10" at 10 button MLX telephones, "MLX-20L" at 20 button MLX display telephones, "BIS-34" at 34 button Analog multiline telephones, and so forth.
4. Indicate the type of adjunct at each location. Write "fax", ans. mach." (answering machine), "headset", or other type of adjunct benethe the symbol.

Figure 1-3 Floor Plan

As shown in Figure 1-3, the floor plan does not need to be elaborate or to scale. The telephone symbol should be large enough to accommodate the size of telephone and the assigned number, and if you find it helpful, the name of the employee.

Keep the floor plan. You will refer to it during planning and complete it (by filling in extension numbers) when you get to "System Numbering" in Chapter 2.

Control Unit

2

Planning the control unit consists of deciding how to place the modules, setting the system operating conditions, and numbering the system.

Modules

Certain modules are required for every system:

- **Processor module** contains the memory that controls the system software and features. It also contains the software and firmware that support built-in system diagnostics and the built-in data modem used for remote maintenance and system programming. The processor module is offered in two sizes:
 - The small processor module supports a maximum of 24 lines and/or 56 stations.
 - The large processor module supports a maximum of 80 lines and/or 144 stations.
- **Power supply module** provides power to the processor module and line and station modules, and to each telephone and adjunct. Each carrier in the control unit has one power supply module.
- **Line and station modules** contain the jacks for connecting stations and outside lines to the control unit. The type of jack on a module determines the type of line or station that can be connected to it.

The line and station modules and the type(s) of jacks on each are shown in Figure 2-1.

Figure 2-1 Line and Station Modules

The lines and stations that can be connected to the jack types shown in Figure 2-1 are described below:

1. A DS1 line jack connects a Digital Signal 1 (DS1) facility provided by the telephone company. The DS1 facility can be set for either T1 or Integrated Services Digital Network Primary Rate Interface (ISDN-PRI) operation.

The DS1 facility programmed for T1 operation supplies 24-channel emulation of any combination of ground-start (GS), loop-start (LS), and tie trunks. When programmed for ISDN-PRI operation, the channels are used to connect ISDN services such as Megacom® WATS.
2. Tie-trunk jacks connect private lines from other communications systems.
3. Line jacks (LS) connect loop-start lines from the telephone company.
4. Power failure transfer (PFT) jacks connect single-line telephones that work during power failures. Analog multiline telephones and digital/ISDN (MLX) telephones cannot be used as power failure telephones.
5. Line jacks (GS/LS) connect loop-start or ground-start lines from the telephone company.
6. Off-premises telephone (OPT) jacks connect off-premises tip/ring equipment such as single-line telephones, fax machines, or answering machines. Tip/ring equipment connects directly to an outside line and works on a single pair of wires.
7. Analog station jacks connect analog multiline telephones and adjuncts.
8. Digital station jacks connect MLX telephones or data devices such as the ISDN 7500B Data Module.
9. Basic telephone station jacks connect tip/ring equipment such as single-line telephones, fax machines, or answering machines. Basic telephone station jacks also connect optional applications such as MERLIN Attendant or MERLIN MAIL Voice Messaging System for the MERLIN LEGEND Communications System.

See the Data Guide for more information on data stations.

Table 2-1 shows the capacities of each module.

Table 2-1 Modules Capacities

Modules	Line Jacks	Station Jacks
100D	1 DS1 facility (ISDN-PRI or T1)	
400EM	4 4-wire E&M tie trunks	
400	4 LS linrs with 4 TTR*	1 PFT jack
400 GS/LS/TTR	4 GS/LS lines with 4 TTR*	1 PFT jack
800	8 LS lines	2 PFT jacks
008 OPT	2 TTR*	8 OPT jacks
800 GS/LS	8 GS/LS lines	2 PFT jacks
008		8 analog jacks
008 MLX		8 digital jacks
012	2 TTR*	12 basik jacks
408	4 LS lines	8 analog jacks, 1 PFT jack
408 GS/LS	4 GS/LS lines	8 analog jacks, 1 PFT jack

* TTR = Touch-tone receivers required for tip/ring equipment and Remote Access. TTRs are not used to connect lines.

Line and Station Capacity

The numbers of jacks in Table 2-1 are the physical jacks on each module. In most cases, the number of physical jacks indicates capacity (the number of lines and/or stations that can be connected to the module). The exception is the 100D module with one physical jack which, because of the system's software capabilities, supports 24 lines.

Use the AT&T Equipment List (supplied with your communications system) to complete page 1 of Key System Form 1, System Planning.

Planning Form Instructions:

Under the heading "Size of Processor Module" check the box describing the size of the processor module (small or large).

Under the "Lines" heading in the "Capacity" section:

1. Fill in the number of each type of line module in the appropriate area.
2. Add the "Number of Modules" column and record the result next to the system totals.
3. Multiply the number of each type of module by the number of lines it supports. Write the results in the appropriate line of the "Total Lines by Module Type" column.
4. Add the "Total Lines by Module Type" column and record the total line capacity of the system.

See "System Numbering" in this chapter for detailed information.

Station capacity is the number of stations that can be connected to the control unit, and it equals the number of physical jacks on the line and station modules.

One extension number is automatically assigned to each station jack, whether or not equipment is connected to it, except for the 008 MLX and 008 OPT modules:

- **008 MLX module** has two extension numbers assigned to each physical jack, the first for a digital/ISDN (MLX) telephone and the second for any equipment connected to the telephone through an MFM.
- **008 OPT module** has eight physical jacks, which the system reads as 12 jacks and assigns an extension number to each.

Planning Form Instructions

Under the heading "Stations":

1. Fill in the numbers of each type of station module on the appropriate lines.
2. Add the "Number of Modules" column and record the result by the system totals.
3. Multiply the number of each type of module by the number of physical jacks on it and record the results.
4. Add the "Physical Jacks by Module Type" column and fill in the "System Totals" line to show station capacity.
5. To determine the number of extensions assigned, multiply the number of physical jacks by module type, by the number of station extensions the system assigns to each module's jack type.
Note: Since the system assigns an additional four extensions to each 008 OPT module, you must multiply the number of 008 OPT modules by four and add this subtotal to the result shown in the "Physical Jacks by Module Type" column.
6. Write the results in the "Total Station Extensions Assigned" column.
7. Add the "Total Station Extensions Assigned" column and fill in the "System Totals" line.

Module Placement

Use the "Control Unit Diagram" on Key System Form 1 and the following guidelines to plan where the modules are placed in the control unit:

- Put the power supply module in the far left slot of each carrier.
- Put the processor module in slot 00 of the basic carrier.
- Put line and station modules in any order in slots 01 through 17, with the following conditions:
 - Put the modules in each carrier from left to right with no empty slots between modules. (The system does not recognize modules in slots after an empty slot; slots to the right of the last module can be left empty.)

- Group all 100D and 400EM modules together according to type, whenever possible, to save time in system programming.

Each physical jack on the control unit is numbered sequentially from left to right and bottom to top:

- **Station jacks are numbered from 1 to 144.**
- **Line jacks are numbered from 1 to 80.**

This sequence of numbers is called the "logical ID." It is the basis for how you connect components to the control unit, as well as how the system assigns station extension numbers and line numbers.

Notes:

- Each 100D module is assigned 24 logical IDs even though the module has only one physical line jack.
- The 008 OPT module is assigned 12 logical IDs even though the module has only eight physical station jacks.
- Power failure transfer (PFT) jacks are not assigned logical IDs.

Planning Form Instructions

Mark the module placement on the "Control Unit Diagram" on the back of **Form 1**.

1. Write the type of module to be installed at the top of each slot. Use the labels listed in Table 2-1 (008 MLX, 408, etc.)
2. Write the type of jack (S= Station, L = Line) and the associated logical ID for each line and station jack on each module.

Notes:

- The "Unit Load" and "Auxiliary Power" blocks above the diagram are reserved for occasions when equipment changes or maintenance require the installation technician to manually compute the values. See *System Reference* for details on computing unit loads.
- Logical ID labels for each line and station jack are provided with the system. When the control unit is assembled, the labels are attached to the modules.

Figure 2-2 shows a completed "Control Unit Diagram" for a system with a large processor module with 32 lines and 52 stations.

Figure 2-2 Sample Control Unit Diagram

System Operating Conditions

Use the "Control Unit Diagram" on Key System Form 1 as a reference and mark the "System Operating Conditions" section of that form.

Record the following system operating conditions:

- programming equipment that will be used and its station jack assignment
- mode of operation
- whether Automatic Maintenance Busy is enabled
- a reminder to set the system time and date

Programming Equipment and Station Jack Assignment

Two types of equipment can be used for system programming:

- an MIX-20L telephone acting as a system programming console. The telephone is the first (lowest) station jack on the first MLX module and is factory set for system programming.
- a personal computer (PC) with MERLIN LEGEND System Programming and Maintenance (SPM) software. (Both DOS and UNIX based SPM are available.) The PC is connected to the lower jack on the processor module.

Use these instructions only if using a system programming console.

Planning Form Instructions

Under the heading "System Programming Console" on Form 1:

1. Do one of the following:
 - Check "NO" if you are using a PC with SPM to program the system. Go to the "Mode of Operation" instructions.
 - Enter the Logical ID and Extension Number if you are using a system programming console.
2. To change the factory-set system programming jack, write in the new logical ID (using information from the "Control Unit Diagram").

Note: You will fill in the extension number of the jack later.

In addition to being factory set for system programming, the first (lowest) station jack on the first MLX module is also factory set as the primary operator position. Since the primary operator position cannot be reassigned to another station jack, you may want to change the system programming assignment to ensure that future programming sessions do not interfere with the operator's work.

If you want the system programming jack to be different from that of a system operator, change the programming assignment to any one of station jacks 2 through 5 on the first MLX module in the control unit.

Mode of Operation

See *System Reference* for more information on modes.

Your system is registered with the FCC to operate as a Key system. However, you can program the system to operate in any of three modes:

- Hybrid/PBX
- Key (the factory setting)
- Behind Switch

The mode of operation determines

- how outside lines are provided to users
- the types of operator consoles allowed
- the features available and how they work.

Note: This book applies only to systems in the Key and Behind Switch modes. To plan a system in the Hybrid/PBX mode, use *PBX System P/arming*.

Key Mode

In the Key mode, every line appears on a separate button on each multiline telephone. The line buttons allow users to see activity on other telephones, join conversations, place calls, or receive calls. Separate intercom buttons are used to make and receive internal calls.

A Key system automatically assigns the first eight outside lines to all telephones. You can customize this arrangement through system programming by assigning lines or groups of lines to selected groups of telephones or to individual telephones.

Behind Switch Mode

The Behind Switch mode is used when the system is connected to another telephone system or Centrex. This other system (called the "host") provides the interface to outside lines and some features.

A Behind Switch system assigns only one line (called a "prime line") to each telephone. You must assign outside lines to telephones or groups of telephones through programming.

In the Behind Switch mode, people can use the special features of both this system and the host system. Compare the host systems feature list and your system to determine which features the two systems have in common.

Once you have determined common features, decide whether you want people to use the features following your system's instructions or following the host system's instructions. (If you decide that the host instructions are to be used, they must be distributed to telephone users.) In the Behind Switch mode, when users press the Conference, Drop or Transfer buttons, a signal is sent to the host system. Get the host system dial code for each of these buttons so that users can take advantage of these features using the host system.

In the Behind Switch mode single-line telephones can be programmed to select only the prime line (the user cannot make inside calls or use system features) or to select the intercom button followed by the prime line or outside line (the user can place and receive inside calls and use system features).

Planning Form Instructions

Under the "Set System Mode" heading on **Form 1**:

1. Check "Key" if you want your system to operate in the Key mode.
2. Check "Behind Switch" if your system is connected behind a larger system. Write the host's dial code for the Conference, Drop, and Transfer features.

Automatic Maintenance Busy

Automatic Maintenance Busy puts a malfunctioning line in a 'maintenance busy' state, preventing outgoing calls on that line. Incoming calls are never blocked. A line in maintenance busy is tested by the internal maintenance software to try to put it back into service.

The factory setting for Automatic Maintenance Busy is 'disabled,' which means that faulty lines are not automatically put in a maintenance busy state. The factory setting, disabled, is satisfactory for most Key and Behind Switch Systems.

Planning Form Instructions

Under the "Automatic Maintenance Busy" heading on **Form 1**:

1. Do *one* of the following:
 - Check "Disable" to keep the factory setting.
 - Check the second box to enable Automatic Maintenance Busy.

System Date and Time

See "System Features" in Chapter 4 for information on SMDR.

The system date and time is the month, day, year, and time shown on display telephones and Station Message Detail Recording (SMDR) reports. The system date and time is also shown on error reports used by AT&T or an authorized representative for maintenance.

Planning Form Instructions

Check "Yes" under both "Set System Date" and "Set System Time" headings on **Form 1** as a reminder to set current date and time.

System Numbering

System numbering is the process of assigning extension numbers to stations (telephones and adjuncts), calling groups, paging groups, Park zones, and Remote Access.

The instructions in this chapter deal only with assigning extension numbers to stations.

Number the stations in two stages:

- **Stage One.** Decide in what order to connect the telephones and other equipment to the control unit. To do this, identify station jack types and match individual components with the jacks that support them.

When the system is turned on, it identifies the type of module installed in each control unit slot and automatically assigns extension numbers to the components in exactly the same order in which they are connected to the control unit. As you plan connections, therefore, you should be aware of the relationship between the jack's logical ID and the extension number the system assigns.

The stations are assigned 2-digit extension numbers starting with extension 10 at the station jack with the logical ID of 1. If a user needs a specific extension number, it is simpler (in terms of programming) to connect that user's telephone to the station jack that is automatically assigned the requested extension number.

- **Stage Two.** Decide if the system-assigned extension numbers are appropriate or if you should renumber all, or some, of the extensions assigned to the stations.

The system offers three predetermined numbering plans. In addition, you have the option of creating your own unique numbering plan with extensions of one to four digits.

Locate and review your **Floor Plan** and **AT&T Equipment List** to verify the equipment you have and how many of each kind of connection are needed.

Record equipment connections and extension numbers on **Key System Form 2a, System Numbering — Station Jacks**.

Note: **Form 2a** is a multipage list that accommodates entries for up to 144 stations. It shows the logical IDs for each station, as well as the three predetermined numbering plans available.

You also need **Key System Form 1, System Planning**, for both reference and to make additional entries.

Station Jack Connections

Planning station jack connections consists of identifying the jack types and matching the telephones and other equipment to the jacks that support them. Determine the station jack types in the control unit and plan connections in the following order:

- primary operator position
- additional operator positions
- Voice Announce to Busy and/or Simultaneous Voice and Data
- digital/ISDN (MLX) telephones
- analog multiline telephones
- tip/ring equipment
- applications

Station Jack Types

Station jack type is determined by the module type. The station jack types and the equipment that can be connected to these jacks are listed in Table 2-2.

Use the completed “Control Unit Diagram” (Form 1) and Table 2-2 for reference and mark the station jack types on Form 2a.

Table 2-2 Station Jack Types

Station Jack Type	Module Type	Used to Connect
Analog	008 408 408 GS/LS	Analog multiline telephones Call Management System (CMS)
Digital	008 MLX	Digital/ISDN (MLX) telephones Digital data devices, such as ISDN 7500B Data Modules
Basic Telephone	012	Tip/ring equipment: Single-line telephones Adjuncts, such as answering ot fax mashines Analog data devices, such as modems Optional applications: MERLIN Attendant MERLIN MAIL Voice Messaging System AUDIX Voice Power — IS II Integrated Voice Power Automated Attendant — IS II
	008 OPT	Tip/ring equipment in another building or off-premises

Planning Form Instructions

In the "Jack Type" column of **Form 2a**, indicate the type of each station jack next to its logical ID.

- 1 . Check "A" if the jack is Analog, "D" if Digital, or "B" if Basic telephone.
- 2 . The system reserves 12 logical IDs for the 008 OPT module even though only 8 are used. Cross off the last 4 logical IDs (they cannot be used).

Jacks for Primary Operator Position

The factory setting for the primary operator position is the lowest station jack on the first 008 MLX module. If the system doesn't have an MLX module, it's the lowest station jack on the first module with analog station jacks. The factory setting for the primary operator position cannot be changed.

On the primary operator position direct-line console (DLC), lines are assigned on individual buttons. The console can have several calls ringing at the same time.

DLCs can be assigned to either a digital or analog station jack.

Planning Form Instructions

Mark jack assignments on **Form 2a**.

If the system does not include a system programming console, go to step 4.

- 1 . See the "System Operating Conditions" on the back of **Form 1** for the logical ID of the station jack for the system programming console.
- 2 . Mark the "Logical ID" column of **Form 2a** by writing "SPC" beside the preprinted logical ID for the system programming console station jack.
- 3 . Write the name of the person who will be programming or the location of the system programming console in the "Person, Location, or Function" column.
- 4 . Locate the first station jack showing a "D" (digital or "A" (analog) type and write "DLC" beside the preprinted logical ID to indicate the primary DLC operator position.
- 5 . Write the name or location of the primary DLC operator in the "Person, Location, or Function" column.

Jacks for Additional Operator Positions

Use these instructions only if the system has more than one operator position.

The maximum numbers of operator positions are shown in Table 2-3.

Table 2-3 Maximum Number of Operator Positions

Telephone Type	Processor Module Size	Maximum Positions
MLX-20L MLX-28D	Small	6
MLX-20L MLX-28D	Large	8
Analog multiline telephones	Small or Large	8

Assign DLCs to only the first and fifth station jacks on a digital or analog module. This includes DLC positions used for calling group supervisors and for the optional Call Management System (CMS).

The CMS equipment is connected to analog station jacks that are assigned as DLC positions. You must assign two DLC positions for each CMS (a maximum of two) connected to the system.

Planning Form Instructions

Use the "Control Unit Diagram" on **Form 1**, to determine which station jacks can be used as operator positions.

1. Circle the first and fifth station jacks on each digital or analog module on the "Control Unit Diagram" until you have reached the maximum eight positions.
2. Mark the station jacks to be used as additional operator positions in the shaded boxes on **Form 2a**.
3. Write "DLC" beside the preprinted logical ID of each position. Be sure to assign DLCs to only the first and fifth station jacks on each digital or analog module.
4. Write the name or location of each additional DLC operator in the "Person, Location, or Function" column.
5. If the system includes the Call Management System(s), write "CMS" in the "Person, Location, or Function" column next to the logical ID for the two DLC positions assigned for each CMS.

Station Jacks Pairs

These instructions apply only to systems with analog multiline telephones.

Two of the optional features for analog multiline telephones require an additional station jack:

- **Voice Announce to Busy.** A user whose telephone has this feature can hear an announcement through the speaker even though he or she is on a call. (MLX telephones can also use this feature but do not need an additional station jack. Single-line telephones cannot use this feature since they do not have speakers.)

- **Simultaneous Voice and Data.** A user whose telephone has this feature can use the telephone and a data terminal at the same time. (MLX telephones have this feature without requiring a second station jack.)

An analog multiline telephone with either one of these features requires two consecutive analog station jacks on the control unit. The jacks are an odd-numbered analog station jack and the next higher (even-numbered) analog station jack.

The system assigns individual extension numbers to each of the jacks for either the Voice Announce to Busy or the Simultaneous Voice and Data feature. The extension number associated with the first (odd-numbered) station jack in the pair is the telephone's extension number. Calls cannot be placed to the extension number associated with the even-numbered station jack.

You can assign either of these features to any of the analog multiline telephones in the system, but you cannot assign both to the same telephone.

Planning Form Instructions

On **Form 2a**, mark the pairs of jacks for analog multiline telephones that have the Voice Announce to Busy or Simultaneous Voice and Data feature.

1. In the "Logical ID" column, draw a box around the pair of station jack numbers that you plan to assign to each analog multiline station with either feature.
2. In the "Person, Location, or Function" column, next to the first (odd) number of each boxed pair, identify the station by person or location.
3. In the "Person, Location, or Function" column, next to the second (even) number of each boxed pair, write "Voice/Voice" for Voice Announce to Busy feature or "Voice/Data" for the Simultaneous Voice and Data feature.

Jacks for Digital/ISDN (MLX) Telephones

Use the instructions in the Data Guide to plan connections for digital data equipment.

Use these instructions only if the system has non-operator MLX telephones to assign to digital station jacks on 008 MLX modules.

Although only one logical ID is assigned to each digital station jack, the system assigns two extension numbers. The extension number on Form 2a is the extension number automatically assigned to an MLX telephone connected to the digital station jack. The second extension number is reserved for an adjunct such as an answering machine that may be connected to the MLX telephone via a Multi-Function Module (MFM) or for an ISDN 7500B Data Module used to connect a data terminal.

The system automatically assigns both extension numbers whether or not the station includes an MFM or data module. Calls can be placed to both extension numbers independently.

The MFM can operate as either a Supplemental Alert Adapter (SAA) or as a tip/ring interface. The adapter is used when the MFM connects an external alert such as a bell or horn. The tip/ring interface, is used when the MFM connects a tip/ring device such as an answering machine or modem.

Planning Form Instructions

Use the **Floor Plan** and **AT&T Equipment List** to verify that you have located all remaining MLX telephones and adjuncts to them.

On **Form 2a**, mark the station jack assignments for the remaining MLX telephones:

1. In the "Jack Type" column, make sure there is a "D" checked next to the logical ID for each digital station jack.
2. In the "Person, Location, or Function" column, identify each MLX telephone by person, location, or function.

Use the information from **Form 2a** as you mark the adjuncts on **Key System Form 2b, System Numbering — Digital/ISDN Station Adjuncts**.

3. In the "Logical ID" column, write the logical ID of each digital station jack (D jack type).

Note: You will fill in the "Factory - Set Extension No." column later.

Complete the "MFM" and "7500B" columns:

4. If the jack does not have an adjunct, write "NONE" across the columns.
5. If an adjunct is connected to the MLX telephone:
 - Check the "7500B" column if the station includes the data module.
 - Check "SAA" or "T/R" in the "MFM" column to show how the MFM connects the adjunct.
6. Complete the last column.
7. Identify each adjunct or data module by type and by person, location, or function.

Jacks for Analog Multiline Telephones

Use these instructions only if the system includes the 408, 408 GS/LS, or 008 modules.

Assign analog station jacks for all remaining non-operator analog multiline telephones in the system.

Planning Form Instructions

On **Form 2a**, mark the station jack assignments for the remaining analog multiline telephones.

1. In the "Jack Type" column, make sure there is an "A" checked next to the logical ID for each analog station jack.
2. In the "Person, Location, or Function" column, identify each analog multiline telephone by person, location or function.

Jacks for Tip/Ring Equipment and Applications

See System Reference for more information on applications.

Use these instructions only if the system includes 012 or 008 OPT modules.

Assign the basic telephone jacks on the 012 or 008 OPT modules to any tip/ring equipment such as single-line telephones, fax machines, or answering machines. Tip/ring equipment connects directly to an outside line and works on a single pair of wires. When connected to a 008 OPT module, the tip/ring equipment can be located off-premises.

Several optional applications, if used with the system, require a basic jack on a 012 module: MERLIN MAIL Voice Messaging System, MERLIN Attendant, AUDIX Voice Power — IS II, and Integrated Voice Power Automated Attendant — IS II.

Up to four applications can be connected to the system using the same 012 module. **If there are four applications, the module must be used exclusively for this equipment** If you have fewer than four applications connected to an 012 module, some tip/ring devices also can be connected. If possible, the module should be used only for the application equipment.

Note: The applications discussed here do not work properly with 012 module manufactured for older MERLIN® II systems. These applications must be connected to 012 modules with the code 517C13 or 517D13 on the label on the top of the module. Modules with the code 517A13 or 517B13 can be used only to connect single-line telephones and do not provide the disconnect signal required by answering machines and applications.

Planning Form Instructions

On **Form** 2a, mark the station jack assignments on the 012 and 008 OPT modules.

1. In the "Jack Type" column, make sure there is a "B" checked next to the logical ID for each basic telephone jack.
2. In the "Person, Location, or Function" column, identify each tip/ring device by person or location, and by type, such as single - line telephone, fax, or answering machine.
3. If the system includes optional applications indicate the type of application in the "Person, Location, or Function" column:
 - Write "Mail" to indicate MERLIN MAIL Voice Messaging System.
 - Write "MERLIN A" to indicate MERLIN LEGEND Attendant.
 - Write "AVP" to indicate AUDIX Voice Power — IS II.
 - Write "IVP - AA" to indicate Integrated Voice Power Automated Attendant — IS II.

System Renumbering

Use these instructions to decide whether to keep the factory-set extension numbers or to change them to numbers tailored to your company — for example, extension numbers that match room numbers.

The system offers three numbering plans, as shown on **Form 2a, System Numbering — Station Jacks**. Each plan allows you to renumber all or selected extensions.

- **Two-Digit** — designed for systems with fewer than 50 stations at businesses that do not anticipate growth to more than 50 stations in the next one or two years. The two-digit numbering plan is the factory setting.
- **Three-Digit** — designed for businesses with more than 50 stations.
- **Set Up Space** — designed for businesses that want to customize numbering and assign 1 to 4 digit extensions that are more convenient for users. As an example, hotels and motels may want to renumber extensions to match room numbers and to renumber services numbers (such as Housekeeping or Room Service) to 1-digit extension numbers.

When you reassign extension numbers, keep the following in mind:

- Extension numbers can contain the digits 0 through 9 in any combination, except that no extension number can begin with 0. (The 0 is a fixed dial code representing the primary operator.)
- Extension numbers can contain one to four digits and must be unique. If you assign an extension number with one or two digits, you cannot use those digits as the leading digits for a longer extension number. For example, if you assign extension numbers 1, 2, 30, and 40, you cannot use those numbers as the first number in longer extension numbers such as 10, 200, 302, or 4052.
- The system-assigned numbers in the shaded areas of the figures on the following pages are automatically reserved. To use any of these numbers for a different station, you must assign a new extension to the station that already has the number you need to use.
- When you reassign an extension number, the extension number vacated is free for you to use.

Select the numbering plan that fits your needs and use the appropriate plan-specific instructions that follow to mark Forms 2a and 2b with your extension number assignments.

Two-Digit Numbering Plan

The extension numbers you assign according to the factory-set two-digit numbering plan are shown in Figure 2-3. The numbers are arranged in blocks according to the first digit. The type of equipment or feature to which they are assigned is shown in the block.

0	Operator Console (not flexible)			
	0			
1	Stations			
	10 — 19			
2	Stations			
	20 — 29			
3	Stations			
	30 — 39			
4	Stations			
	40 — 49			
5	Stations			
	50 — 59			
6	Stations		Extra Stations	Extra Adjunct
	60 — 67		6800 — 6885	6900 — 6985
7	Main Pool	MFMs & 7500Bs	Calling Group	
	7 0	710 — 767	770 — 791, 7920 — 7929	
8	A	Lines	Park	B
		801 — 880	881 — 888	Pools
				890 — 899
9	ARS Access (Hybrid/PBX Mode)/Idle Line Access			
	9			

Figure 2-3 Two-Digit Numbering Plan

A = 800-Listed Directory Number

B = 889—Remote Access

Each of the first 58 station jacks is assigned a 2-digit extension number beginning with extension 10 and ending with extension number 67. The rest of the stations (68–144) are assigned 4-digit extension numbers 6800–6885. Extra adjuncts are assigned as extensions 6900–6985.

The extension numbers shown for MFMs/7500Bs (710–767) are reserved for a station adjunct connected to an MLX telephone such as a data terminal connected through an ISDN 7500B Data Module or an answering machine connected using an MFM. The extension numbers are reserved whether or not an adjunct is connected to the telephone.

For the first 58 digital station jacks, the actual extension number assigned to the adjunct is the extension number assigned to the MIX telephone preceded by a 7. For example, if the extension number assigned to an MIX telephone is 25, the extension number assigned to the adjunct on that telephone is 725. In this example, a call can be placed to the telephone by dialing extension 25 or to the adjunct by dialing extension 725. If you reassign the extension number of the telephone, the system does not automatically change the extension number of the MFM or data module.

See the CMS documentation for more information on reassigning numbers for CMS agent splits.

Note: If your system includes the CMS, it assigns extension numbers to agent splits.

The unshaded areas of the two-digit numbering plan in Figure 2-3 indicate the extension numbers available for reassignment. This means that you can change selected extension numbers to one of the available numbers, for example, extensions 6886 through 6899. If the available numbers shown do not meet your needs, consider the three-digit numbering plan.

Planning Form Instructions

Use Figure 2-3 as you record extension number information.

1. If the system includes digital station adjuncts.
 - Locate **Key System Form 2b, System Numbering — Digital/ISDN Station Adjuncts**.
 - Write the 3 digit extension number — the extension number from **Form 2a** with a "7" preceding it — in the "Factory - Set Extension No." column of **Form 2b**.
2. If you do not need to renumber any of the factory - set extension numbers:
 - Check the "2 - Digit" box under the "Renumber To" heading on **Form 2a**.
 - Go to the "Form and Floor Plan Update" instructions later in this chapter.
3. If you want to renumber only a few of the extensions, and enough numbers are available.
 - Check the "2 Digit" and "Selected Extension Numbers" boxes under the "Renumber System" heading of **Form 2a**.
 - Write the new extension number(s) in the "Renumber To" column on **Form 2a** and **Form 2b**.
 - Go to the "Form and Floor Plan Update" instructions later in this chapter.

Three Digit Numbering Plan

Figure 2-4 shows the numbers automatically assigned by the system when you renumber with the three-digit numbering plan. The numbers in the figure are arranged in blocks according to the first digit. The type of equipment or feature to which they are assigned is shown in the block.

0	Operator Console (not flexible) 0			
1	Stations 100—199			
2	Stations 200—243			
3	MFMs/7500Bs 300—399			
4	MFMs / 7500Bs 400 — 443			
5				
6				
7	Main Pool 70		Calling Group 770—791, 7920—7929	Page 793—799
8	A	Lines 801 — 879	Park 881—888	B Pools 890—899
9	ARS Access (hybrid/PBX Mode)/Idle Line Access 9			

Figure 2-4 Three-Digit Numbering Plan

A = 800—Listed Directory Number
B = 889—Remote Access

All stations are assigned a 3-digit extension number beginning with extension 100 and ending with extension 243.

The extension numbers shown for MFMs/7500Bs (300–443) are reserved for station adjuncts connected to an MLX telephone such as a data terminal connected through an ISDN 7500B Data Module or an answering machine connected using an MFM. The extension numbers are reserved whether or not an adjunct is connected to the telephone.

The actual extension number assigned to the adjunct is the extension number assigned to the MLX telephone increased by 200. For example, if the extension number assigned to an MLX telephone is 125, the extension number assigned to the adjunct on that telephone is 325. In this example, a call can be placed to the telephone by dialing extension 125 or to the adjunct by dialing extension 325. If you reassign the extension number of the telephone, the system does not automatically change the extension number of the MFM or data module.

See the CMS documentation for more information on reassigning numbers for CMS agent splits.

Note: If your system includes the CMS, it assigns extension numbers to agent splits.

The unshaded areas of the three-digit numbering plan in Figure 2-4 indicate the extension numbers available for reassignment. This means you can change the extension number automatically assigned by the system to one of the available numbers, for example, extension number 244 through 299. If the available numbers shown are not adequate to meet your needs, consider the set up space numbering plan.

Planning Form Instructions

Use Figure 2-4 as you record the extension number information.

- 1 . If the system includes digital station adjuncts:
 - Locate **Key System Form 2b, System Numbering — Digital/ISDN Station Adjuncts**.
 - Write the 3-digit extension number—the extension number from **Form 2a** increased by 200 (within the range 300-443)—in the "Factory-Set Extension No." column of **Form 2b**.
- 2 . If you do not have to renumber any of the 3-digit extension numbers:
 - Check the "3-Digit" box under the "Renumber System" heading on **Form 2a**.
 - Go to the "Form and Floor Plan Update" instructions later in this chapter.
- 3 . If you want to renumber only a few of the 3-digit extensions and enough numbers are available in the three-digit numbering plan:
 - Check the "3-Digit" and "Selected Extension Numbers" boxes under the "Renumber System" heading on **Form 2a**.
 - Write the new extension number(s) in the "Renumber To" column on both **Form 2a** and **Form 2b**.
 - Go to the "Form and Floor Plan Update" instructions later in this chapter.

Set Up Space Numbering Plan

Figure 2-5 shows the numbers automatically assigned when the system is renumbered using the set up space numbering plan. The numbers in the figure are arranged according to the first digit. The type of equipment or feature to which they are assigned is shown in the block.

0	Operator Console (not flexible) 0					
1						
2						
3						
4						
5						
6						
7	Main Pool 70	Stations 7100—7243		MFMs/7500Bs 7300—7443	Calling Group 770—791, 7920—7929	Page 793—799
8	A	Lines 801—880			Park 881—888	B Pools 890—899
9	ARS Access (Hybrid/PBX Mode) /Idle Line Access 9					

Figure 2-5 Set Up Space Numbering Plan

- A = 800—Listed Directory Number
- B = 889—Remote Access

As shown in Figure 2-5, the system assigns extension numbers in the 7100 to 7243 range to stations. This makes numbers beginning with 1 through 6 available for use in reassigning extension numbers. These new extensions can be from one to four digits long. The unshaded areas of the setup space numbering plan in Figure 2-5 indicate the extension numbers available for reassignment.

The extension numbers shown for MFMs/7500Bs (7300–7443) are reserved for station adjuncts connected to an MLX telephone, such as a data terminal connected through an ISDN 7500B Data Module or an answering machine connected using an MFM. The extension numbers are reserved whether or not an adjunct is connected to the telephone.

The actual extension number assigned to the adjunct is the extension number assigned to the MLX telephone increased by 200. For example, if the extension number assigned to an MLX telephone is 7125, the extension number assigned to the adjunct on that telephone is 7325. In this example, a call can be placed to the telephone by dialing extension 7125 or to the adjunct by dialing extension 7325. If you reassign the extension number of the telephone, the system does not automatically change the extension number of the MFM or data module.

See the CMS documentation for more information on reassigning numbers for CMS agent splits.

Note: If your system includes the CMS, it assigns extension numbers to agent splits.

Planning Form Instructions

Use Figure 2-5 as you record extension number information.

1. If the system includes Digital station adjuncts:
 - Locate **Key System Form 2b, System Numbering — Digital/ISDN Station Adjuncts**.
 - Write the 4-digit extension number — the extension number from **Form 2a** increased by 200 (within the range 7300–7443)—in the "Factory Set Extension No" column of **Form 2b**.
2. Under the "Renumber System" heading of **Key System Form 2a**:
 - Check "Set Up Space."
 - Write the new extension number(s) in the "Renumber To" column on both **Form 2a** and **Form 2b**.

Form and Floor Plan Update

Make sure that your system numbering plan decisions are recorded on all the appropriate forms.

Planning Form Instructions

On the **Floor Plan**, add the extension numbers you have assigned underneath the description of the telephones (such as MLX-10 or BIS-34) and adjuncts.

On **Key System Form 1, System Planning**, in the "System Operating Conditions" section, if you are using a system programming console, add the new extension number of the console in the space next to the "Ext. No."

Lines

3

Planning for lines consists of deciding how to connect outside lines to the system, selecting options for how those lines will work, and assigning lines to user stations.

Line Connections

Plan line connections by identifying line jack types and matching outside lines and auxiliary equipment to the jack types that support them.

Use the “Control Unit Diagram” on Key System Form 1 and the local telephone company line information list as you record connections on Key System Form 2c, System Numbering — Line Jacks.

Line Jack Types

The line jack type is determined by the type of module. The following table shows the line jack types, the module types that contain them, and the outside line or equipment they support.

Table 3-1 Line Jack Types

		Used to Connect	
Line Jack Type	Module Type	Line Type	Equipment
Loop-start (LS)	400 800 408	<ul style="list-style-type: none"> ■ Basic ■ Special purpose — FX, WATS 	Music-on-Hold Loudspeaker paging systems Maintenance Alarm
Ground-start/Loop-start (GS/LS)	400 GS/LS/TTR 800 GS/LS 408 GS/LS	<ul style="list-style-type: none"> ■ Basic ■ Special purpose — FX, WATS 	Music-on-Hold Loudspeaker paging systems Maintenance Alarm
Tie	400EM	Tie	
DS1	100D	T1 ISDN-PRI	

If the system has 100D (DS1) modules, keep in mind that 24 logical IDs and associated line numbers are assigned to each module.

See “DS1 Facility (100D Module)” later in this chapter for information on ISDN-PRI services.

When the system is first set up, it automatically assigns the T1 type to the facility connected on a 100D module. This means you can dedicate the channels for use as T1-type lines and use the channels to emulate any combination of loop-start, ground-start lines, and/or tie trunks. If this is the case, your local telephone company supplies the telephone numbers associated with each of the channels on the DS1 facility.

You can also connect certain digital services such as Megacom® 800 to the T1-type facility or change the module’s service type to ISDN Primary Rate Interface (ISDN-PRI) to allow connection of services such as Accunet® Switched Digital Service.

Note: You cannot mix T1 and ISDN-PRI types of service on the same 100D module.

3-2 Line Connections

Planning Form Instructions

Review the module listed on the "Control Unit Diagram" on **Form 1**.
 On **Key System Form 2c, System Numbering — Line Jacks**:

1. Write the type of each line jack in the control unit in the "Jack Type" column. Use the codes shown in Table 3-2.

For systems that include the 100D module:

2. If the module is used only to emulate lines:
 - Fill in the jack type codes for those lines (T1-GS, T1-LS, or T1-Tie).
 - Write only "T1" in the "Jack Type" column for any of the channels not used at this time.
3. If the module is used to connect services:
 - Write "T1-Tie" in the "Jack Type" column for those T1-type module channels where the services are assigned.
 - Write "PRI" in the "Jack Type" column for all 24 logical IDs of the ISDN - PRI-type modules.

Table 3-2 Coding Line Type

Jack Type Code	Line Type
LS	Loop-Start
GS/LS	Ground-Start/Loop-Start
Tie	Tie
T1-GS	DS1 facility used to emulate GS
T1-LS	DS1 facility used to emulate LS
T1-Tie	DS1 facility used to emulate tie or for digital service
PRI	DS1 facility used for ISDN-PRI service

Jacks for Outside Lines

Identify the specific outside lines you want to connect to each loop-start and ground-start/loop-start line jack. Connect outside lines to a continuous sequence of line jacks on the control unit, beginning with the first line jack (logical ID 1). Use line jacks at the beginning of the sequence for basic loop-start lines. Use jacks later in the sequence for special-purpose lines such as WATS or FX (foreign exchange).

Group lines together according to type: basic loop-start lines or special-purpose loop-start lines. PRI, T1, and tie trunks are automatically grouped according to type since they require specific types of modules. Your local telephone company supplies the information you need to identify the specific lines connected to each line jack on each tie-trunk module and each channel on each 100D module.

Note: If the system is registered with the FCC registration number of AS59CM-7914-KF-E, only loop-start lines can be connected to the GS/LS type line jacks. With the KF registration number, ground-start lines are allowed only when the system includes a DS1 facility dedicated as a T1 type and the channels are used to emulate ground-start lines.

Planning Form Instructions

1. On **Form 2c**, under "Line Type", write the type of line or tie trunk you plan to connect to each line jack or T1 channel—basic, FX, WATS (include band), tie, (refer to the local telephone company line information list).
 - If a line such as WATS is only inbound or outbound (not two way), include that information along with the line type.
 - If the jack type shown in the "Jack Type" column is GS/LS, next to the line type (basic, FX, or WATS), write either "GS" or "LS" to indicate the line type. For a T1 line not used at this time, write "unequipped".

Note: For other T1 or PRI lines, the kind of service connected (such as Megacom 800) will be completed later.

2. In the "Telephone Number or Equipment" column, write the telephone number for each outside line on the line with the logical ID for its line jack. If you don't yet know the telephone number, leave the column blank and enter the information later.

Note: Be sure the line type associated with each telephone number matches the jack type.

An example of a partially completed Form 2c is shown in Figure 3-1. The remaining entries (Rotary Dial, etc.) are covered in the "Line Options" instructions later in this chapter.

Key System Form 2c

17										

Figure 3-1 Partially Completed Form 2c, System Numbering — Line Jacks

Jacks for Auxiliary Equipment

Use these instructions only if the system has auxiliary equipment such as Music-on-Hold.

Auxiliary equipment can be connected only on loop-start (LS) or ground-start/ loop-start (GS/LS) jack types. You cannot use a line jack on a 100D or 400EM module for auxiliary equipment.

If you plan to use Music-on-Hold, designate a line jack for the music source such as a radio, tape player, stereo system, or Magic on Hold equipment.

If the system includes loudspeaker paging, designate one or more line jacks for the paging equipment. A maximum of three line jacks can be designated for paging systems.

If you plan to use the Maintenance Alarm feature (an audible alert for system maintenance problems requiring immediate action), designate a line jack for the external alert.

To make it easier to add outside lines in the future, use the last line jack(s) on the right-most module with either LS or GS/LS line jacks to connect auxiliary equipment.

Planning Form Instructions

Use the **Floor Plan** and **AT&T Equipment List** to verify the auxiliary equipment to be connected.

At the top of **Form 2c**, fill in the Logical IDs for each type of auxiliary equipment planned.

1. Next to "Music-on-Hold", write the Logical ID of the line jack for this equipment. Include the music source (tape, radio, etc...) on the line provided.
2. Next to "Loudspeaker Page", write the logical IDs of the line jack(s) for the paging equipment (maximum of 3).
3. Next to "Maintenance Alarm", write the logical ID of the line jack for the maintenance Alarm external alert.

Note: If you use equipment that rebroadcasts music or other copyrighted materials, you may be required to obtain a copyright license from, and pay license fees to, a third party such as the American Society of Composers, Artists, and Producers (ASCAP) or Broadcast Music Incorporated (BMI). Or, you can purchase a Magic on Hold system, which does not require you to obtain such a license, from AT&T or your authorized dealer.

Line Options

Choose from the following options for the outside lines connected to the system and record your decisions on **Key System Form 2c, System Numbering — Line Jacks**:

- Loop-Start Disconnect Reliability
- Rotary Dial Lines
- Toll Prefix Dialing Requirements (Toll Type)
- Hold Disconnect

If the system includes any or all of the following additional line options, mark the Outside Lines forms (3a, 3c, and 3D):

- Remote Access
- DS1 Facility
- Tie Trunks

Loop-start Disconnect Reliability

The disconnect signal is sent by the telephone company to the system when an outside caller hangs up. Disconnect signals on incoming calls on loop-start lines are classified as either reliable or unreliable. If reliable, on every call a disconnect signal is sent to the system by the local telephone company shortly after a caller hangs up. If unreliable, a disconnect signal is not sent by the local telephone company on every call.

Since the disconnect signal on most loop-start lines is unreliable, the factory setting for the disconnect signal is "unreliable."

Specifying that the disconnect signal for loop-start lines is reliable allows some features to function better—for example, Remote Call Forward, remote call transfers, and voice messaging systems such as MERLIN MAIL Voice Messaging System.

See "Hold Disconnect" later in this section.

Note: If the local telephone company uses a short Hold Disconnect interval, do not specify a reliable disconnect signal.

Before you change the setting to reliable, check with your telephone company to determine whether the disconnect signals for the loop-start lines are reliable and to obtain the length of the Hold Disconnect interval.

Planning Form Instructions

At the top of **Form 2c**, under the "Loop-Start reliable Disconnect" heading, do one of the following:

- Check "No" if the loop-start lines have an unreliable disconnect signal.
- Check "Yes" if the loop-start lines have a reliable disconnect signal.

Rotary Dial Lines

The system is factory set to generate touch-tone signals when users dial outside calls. Identify any rotary dial lines that are connected to the system so that rotary dial signals can be used for these lines.

Note: Touch-tone single-line telephone users cannot make calls using lines programmed for rotary operation.

Check with your local or long-distance telephone company to determine which, if any, lines connected to the system are rotary dial lines.

Planning Form Instructions

In the "Outmode Rotary Dial" column on **Form 2c**, check "Yes" to show rotary dial lines or "No" to show touch-tone.

Toll Prefix Dialing Requirements (Toll Type)

Toll Type allows the system to classify calls as either local or toll, based on the number dialed by the user. Normally, people have to dial a toll prefix (1 or 0) before dialing the area code and telephone number for a toll call. In some areas this is not necessary; dialing a prefix depends on local telephone company requirements and the type of line used.

Find out from your local telephone company which lines require a toll prefix. This information is used by the system when a toll call is placed by a telephone or data terminal on ground-start or loop-start lines.

Note: The Toll Type feature does not apply to tie trunks.

Planning Form Instructions

In the "Toll Prefix Not Needed for LD" column on **Form 2c**, check "Yes" next to any lines that do not need a prefix for toll calls.

Hold Disconnect

Hold Disconnect allows you to set the number of milliseconds (ms) before the line is released when a caller on hold hangs up and abandons the call. Local telephone companies use either a long (450 ms) or short (50 ms) interval. The factory setting for the system is the long interval since it is the interval used by most telephone companies.

Check with your local telephone company for the disconnect interval used.

If your local telephone company uses the short interval, you must change the factory setting. If you don't change the setting, when a caller waiting on hold hangs up, the line is not released.

Planning Form Instructions

In the "Short Hold Disconnect Interval" column of **Form 2c**, check "Yes" next to any lines that you want to change from the long (450mn) interval to the short (50 ms) interval.

Note: Be sure you have checked "No" for "Loop-Start Reliable Disconnect" if your local telephone company uses a Short Hold Disconnect interval.

See "Loop-Start Disconnect Reliability" earlier in this section.

Remote Access

Use these instructions only if remote users need access to the system.

Remote Access allows people to use the system from a remote location. A person working away from the office can call into the system on one of the lines programmed for remote access. The system answers the call, and the user can then do the following:

- dial extension numbers directly without going through the system operator. This means that a remote employee can call internal telephones, data terminals, or calling groups just as if the call were being placed from an internal telephone.
- select a line pool, or special-purpose line, such as WATS or FX, to make outgoing calls. If the line is busy, you can specify that the remote caller is eligible for Automatic Callback. This means the caller can remain on the call and not have to keep calling back to get an outgoing line.

Note: Calls made via Remote Access to locations outside the system may vary in transmission quality

- activate, change, or cancel the Call Forward telephone or extension number programmed on a telephone.

Remote Access also allows remote system programming and maintenance by AT&T or your authorized dealer.

To have Remote Access, the control unit must contain one or more 400, 400 GS/LS/TTR, 008 OPT, or 012 modules. These modules have touch-tone receivers, which are required to make the Remote Access feature work. Check the Control Unit Diagram on **Form 1** to verify that one of these types of modules is present before you begin planning Remote Access.

Note: The lines assigned Remote Access do not have to be connected to the module with the touch-tone receiver.

It is recommended, but not required, that Remote Access lines appear on line buttons on an operator console. This allows the operator to manually disconnect a call in case an incoming call on that line does not disconnect properly.

You can provide security for the system by requiring that people using Remote Access dial a password or barrier code to call into the system. When barrier codes are required, the caller dials a 4-digit number after the Remote Access special dial tone and then hears the system dial tone.

CAUTION

Under applicable tariffs, the customer is responsible for any charges incurred through the remote use of system facilities. Precautions should be taken to prevent unauthorized use of the system's outside lines by remote callers, also called "toll fraud." See "Customer Support Information" at the front of this book for more information on security.

You must decide which lines you want to be used for either Dedicated or Shared Remote Access:

- When you assign Dedicated Remote Access to a line, all calls coming in on that line receive the Remote Access treatment. This means that the caller hears the system dial tone if no barrier codes are setup for the line, or a special dial tone if you specify that a barrier code is needed.
- When you assign Shared Remote Access, calls coming in on that line receive the Remote Access treatment only when the system is in Night Service (see Chapter 4).

You can assign Remote Access to any outside line connected to the system except dial-in tie trunks. For dial-in tie trunks, Remote Access is achieved by dialing the factory-set Remote Access code, 889.

You may want to begin by assigning Remote Access to only a few lines and increasing the number later if more are needed. Keep in mind that Remote Access should not be assigned to lines and tie trunks that are used for incoming customer calls.

See "System Numbering" in Chapter 2. Review the numbers available in the numbering plan you have selected.

Once you have decided which lines are to be used for Remote Access, decide whether you want to change the factory-set access number from 889 for dial-in tie trunk.

Planning Form Instructions

Mark **Key System Form 3a, Outside Lines — Remote Access**.

At the top of the form:

1 . To change the factory-set access code:

- Write the new number in the "Renumber To" space.
- Locate **Key System Form 2d, System Numbering — Special Renumbers** and write the new number in the "Renumber To" column of the "Remote Access Code" section of the form.

Planning Form Instructions—Continued

2. Under the heading "Automatic Callback" at the top of **Form 3a**:
 - Check "Disable" if you do not want remote callers to use this feature.
 - Check "Enable" to allow this feature to remote callers.
3. Under the heading "Barrier Codes for Tie Trunks":
 - Check "Yes" if you plan to assign barrier codes to these lines.
 - Check "No" if no barrier codes are planned.
4. For "Barrier Codes for Non-Tie Lines":
 - Check "Yes" if you plan to assign barrier codes.
 - Check "No" if no barrier codes are planned.

For all lines to which you are assigning Remote Access:

5. Transfer the information from **Key System Form 2c, System Numbering — Line Jacks** to **Form 3a**.
 - Write the logical ID and the line number in the applicable column.
 - Check either the "Tie Trunk" or "Non-Tie Line" column.
 - Complete the "Line Type and Description" column. Include the different bands (calling areas) of WATS lines and different destinations for FX lines.
6. Check the "Shared" column (to indicate shared access) **or** the "Dedicated" column (to indicate dedicated access for the lines).

Class of Restriction

The class of restriction is assigned to all lines with Remote Access. If barrier codes are planned, you also must assign the class of restriction for each barrier code.

Make the following decisions regarding class of restriction:

- **Restriction.** The setting determines whether users can make local and/or toll calls (the factory setting is for inside calls only).
You can change the setting to unrestricted (the users can make local and toll outside calls) or restricted (the user can make only local outside calls).
- **Allowed List Assignment** When users are restricted from making local and/or toll calls, you can assign up to eight Allowed Lists that allow restricted users to call specific numbers (local or toll).
- **Disallowed List Assignment** When users are not restricted from making calls, you can assign a Disallowed List that prevents them from dialing specific numbers on the list.

See Chapter 4 for information on Allowed and Disallowed Lists.

Barrier Codes

To help safeguard against unauthorized system access, the system can be programmed to require that remote users enter a barrier code before gaining access to the system. AT&T strongly recommends the use of barrier codes.

CAUTION

Under applicable tariffs, the customer is responsible for any charges incurred through the remote use of system facilities. Precautions should be taken to prevent unauthorized use of the system's outside lines by remote callers, also called toll fraud. See "Customer Support Information" at the front of this book for more information on security.

Barrier codes can be used for tie trunks or non-tie trunks. A maximum of 16 barrier codes is allowed, each with a different class of restriction. The class of restriction allows or denies the use of system features to individuals or groups of users.

Planning Form Instructions

Record class of restriction on **Form 3a**. Use page 3 for class of restriction without barrier codes and page 4 for class restriction with barrier codes.

Note: Page 4 of Form 3a holds programming information for four barrier codes. Duplicate the Form if More barrier codes are planned.

Page 3 of Form 3a, has two sections: "Tie Trunks" and "Non-Tie Trunks." For each section:

1. Check "Outward restrict" to keep the factory setting.
2. Check either "Unrestricted" or "Toll Restrict" to change from outward restricted.

Under the "Allowed List Access" and "Disallowed List Access" headings:

3. Check the boxes if you plan to assign these lists.

Note: The Allowed and Disallowed List numbers will be filled in later.

On **page 4 of Form 3a**, for each barrier code:

4. Write the barrier code number in the space provided. Start with 1 and number sequentially.
5. Write the 4-digit barrier code in the "Digits" space. To keep the code private, leave the space blank.
6. Repeat Steps 1 through 3 listed under the page 3 instructions.

DS1 Facility (100D Module)

Use these instructions only if the system has a 100D module. Because of the complexity of DS1 facility planning, consult with your AT&T representative or authorized dealer as you work through these instructions.

A Digital Signal 1 (DS1) facility is a transmission system that transports digital signals in the DS1 format. The 100D module is the interface that allows the connection of DS1 facilities to the system. Through this module, voice and data calls can be placed on or received by a DS1 facility.

Note: The small processor module supports one 100D module; the large processor module supports up to three 100D modules.

Twenty-four Digital Signal 0 (DS0) channels, each operating at 64 kbps, plus framing bits, are multiplexed, forming a DS1 signal of 1.544 Mbps. Each DS0 channel within the DS1 signal corresponds to a logical endpoint. Even though there is only one physical jack, the 100D module supports up to 24 logical endpoints (IDs) or ports (one for each channel).

In DS1 format, calls to other digital communications systems (digital PBXs) or central offices remain digital, and signals do not need to be converted to analog for acceptance by the connecting line.

To connect the 100D module to a DS1 facility, a channel service unit (CSU) is normally used to regulate the transmission into and out of the 100D module so that the module matches the transmission of the outside facility. The CSU is a hardware component needed when two endpoints are located in different buildings or when the distance between the two endpoints makes line repeaters necessary. Repeaters re-amplify incoming signals so that signal strength is not lost over long distances.

To ensure that both ends of the DS1 facility "speak the same language," the following options are set during programming:

- Type of Service
- Frame Format
- Line Code
- Line Compensation
- Clock Synchronization
- Signaling Mode

The appropriate setting for each option is determined by the transmission facility to which the module is connected. Each option is discussed below.

Type of Service

The system supports two types of service for DS1 facilities: T1 and Integrated Services Digital Network Primary Rate Interface (ISDN-PRI). T1 service (the factory setting) transmits and receives voice, and analog data; ISDN-PRI transmits and receives voice and analog and digital data.

Table 3-3 shows the kinds of services available through a DS1 facility and specifies the type of service that supports them. Review the table with your AT&T representative or authorized dealer and decide the type of service for the 100D module(s).

Table 3-3 Services on the DS1 Facility

Service	Description	T1*	ISDN-PRI
Megacom (Megacom WATS)	An outgoing, domestic long-distance service used in place of WATS service.	x	x
Megacom 800	An incoming, domestic toll-free number service for voice calls.	x	x
Megacom/Megacom 800	Adding Shared Access for Switched Service (SASS) allows Megacom and Megacom 800 service on the same lines.	x	x
Megacom 800 with Dialed Number Identification Service (DNIS)	An incoming, domestic toll-free number service that provides voice information service on an interactive basis. Calls can be routed to separate departments or prerecorded messages can be played for different groups of callers.	x	
MultiQuest®	An incoming domestic 900 number service for voice and data calls.	x	x
MultiQuest with DNIS	An incoming 900 number service that provides callers with voice and data information service on an interactive basis.	x	

* Factory setting.

Table 3-3 Continued

Service	Description	T1*	ISDN-PRI
Software Defined Network (SDN)	A virtual private networking service for voice and circuit-switched analog data calls (up to 56 kbps). SDN lets businesses use portions of the AT&T Switched Network in concert with their dedicated private line networks. However, the system does not support "uniform dialing plan," which is necessary for complete integration with SDN.	x	x
Accunet Switched Digital Service	A digital switching service between subscriber data stations and far-end connection. Useful for batch data or file transfers, high-speed faxes, etc.		x
Station Number Identification/Automatic Number Identification (SID/ANI) Note: The availability of the caller identification information may be limited by local-serving (caller's) jurisdiction, availability, or central office equipment.	A caller identification service for systems with display telephones, call report systems, etc. <ul style="list-style-type: none"> ■ SID allows the called station to display the station number of the caller. ■ ANI allows the called station to display the billing number (main telephone number) of the caller. Subscribers can choose to send their own calling information to other subscribers for display or to suppress the outgoing caller identification.		x

See "Tie Trunks" later in this chapter.

If you choose the T1 type for services, program the module to emulate tie trunks to the central office.

* Factory setting,

See "Signaling Mode" in this chapter.

Planning Form Instructions

On **Key System Form 2c, System Numbering — Line Jacks**, in the "Jack Type" column:

- 1 . Find all lines listed as "PRI"
 - Write the kinds of service connected to each channel in the "Line Type" column.

Note: You cannot use the 24th channel for services.

 - Write "unequipped" in the "Line Type" column for any channel not used at this time.

- 2 . Find all lines listed as "T1—Tie" that do not show "unequipped" in the "Line Type" column, and write the kind of service connected to each channel in the "Line Type" column.

Note: If the signaling type is common - channel, you cannot use the 24th channel, and you must program the module for tie-line emulation.

On page 1 of **Key System Form 3c, Outside Lines — DS1 Facility (100D Module)**, for each 100D Module in the system.

- 3 . Write the number of the control unit slot that contains the module in the "Slot No." blank. (Refer to the "Control Unit Diagram" on **Form 1.**)

If more than one 100D Module is used, complete the first column, "Module 1", to show the options assigned to the 100D Module in the lowest number control unit slot. Use the second column for the second lowest number slot, and the last column for the highest number slot.

- 4 . Show the service connected to each 100D MOdule under the "Type of Service" heading.
 - Check "T1`" (the factory-setting) if the module is used for emulated lines and/or services such as Megacom 800 with DNIS.
 - Check "ISDN—PRI" if the module is used exclusively for services such as Accunet Switched Digital Service.

Frame Format

To identify the DS0 channels, the DS1 signal is segmented into blocks of 193 bits, called frames. A frame consists of 24 eight-bit words (one for each channel) plus a framing bit at the beginning of each frame: 24 words x 8 bits = 192 bits. Thus, a framing bit appears in every 193rd bit position of the 1.544-Mbps DS1 signal.

Frames repeat at a rate of 8000 per second, with each frame repeating DS0 channels 1 through 24 sequentially.

Two methods of framing can be used by a 100D module, but the framing chosen must match the framing at the far end:

- **D4 Framing Format** The system is factory set for the most common framing format, D4 framing. A D4 frame consists of 24 eight-bit time slots and one framing bit. To synchronize the signals, the receiving equipment uses the framing information to identify the start of each frame and to identify which frames contain signaling information. The framing information repeats once every 12 frames; these 12 frames form the D4 superframe. This framing format is used by most DS1 equipment.
- **ESF Framing Format** The extended superframe (ESF) format extends the 12-frame D4 superframe to a 24-frame superframe, hence its name. The 24 framing bits include a cyclic redundancy check (CRC) for the entire extended superframe and a facility data link for maintenance. The ESF can detect more errors than D4 framing; however, ESF is not used universally by DS1 equipment. The ESF frame format is required for ISDN-PRI and international data transmission.

Line Code

The DS1 signal consists of a continuous bit stream of ones and zeros, encoded into bipolar pulses for transmission. Only the ones create a pulse; the zeros are represented as the absence of a pulse. The line-coding formats guarantee that the ones-density requirement is met to achieve clock recovery.

To meet the ones-density requirement, either alternate mark inversion zero code suppression (ZCS) or bipolar 8 zero substitution (B8ZS) line coding is used. The factory-set line coding is ZCS.

- **AMI-ZCS.** ZCS line coding monitors each DS0 channel and prevents strings of eight or more zeros. Upon detecting eight consecutive zeros in a channel octet, ZCS line coding forcibly changes the seventh zero (second least significant bit) to a one.

With ZCS line coding, any bit that is overwritten has no noticeable effect on voice and voice-grade data. However, the ZCS line-coding format can cause errors in digital data transmission.

- **B8ZS.** B8ZS line coding encodes an all-zero channel octet into a unique binary sequence with a "bipolar violation" in bit positions 4 and 7. Normally, for bipolar transmission ones are encoded alternately as a positive then negative, or negative then positive, pulse. If two positive or two negative pulses are received in succession, a bipolar violation occurs.

Ordinarily, bipolar violations are caused by noise hits on the signal. However, B8ZS line coding allows the 8-bit strings to be detected at the receiving end and converted back into the original sequence.

B8ZS line coding is preferred over ZCS because it does not cause errors in data transmission. B8ZS violations will be passed by the ESF T1 Channel Service Unit, but not by other CSUs.

Line Compensation

Line compensation adjusts for the amount of cable loss in decibels (dBs). It is based on the length of cable between the 100D module and the CSU or between the module and another far-end connection—for example, a line repeater.

The factory setting is a value of 1, which allows a maximum loss of 0.6 dB. The other possible settings are shown in Table 3-4 (based on 22-gauge cable).

Table 3-4 Line Compensation Settings

Setting	dB Loss	Cable Feet
1*	-0.6	0–133
2	-1.2	133–266
3	-1.8	266–399
4	-2.4	399–533
5	-3.0	533–655

Planning Form Instructions—Continued

On **Form 3c**, for each module in the system:

5. Under the "Frame Format" heading:
 - Check "D4" to retain the factory setting.
 - Check "ESF" to change the factory setting (required for ISDN-PRI and International data transmission).
6. Under the "Supression" heading:
 - Check "AMI-ZCS" to retain the factory setting.
 - Check "B8ZS" to change the factory setting (required for ISDN-PRI).

Under the "Line Compression" heading:

7. Fill in the approximate distance (number of cable feet) between the 100D module and the CSU or other far-end connection next to "Cable Feet".
8. Use Table 3-4 to select the line compensation setting needed.
 - Check "1" (.6db) to retain the factory setting.
 - Check the setting (2-5) required because of the distance between the module and the CSU or other far-end connection.

* Factory setting.

Clock Synchronization

Clock synchronization is an arrangement in which digital facilities operate from a common clock. Whenever digital signals are transmitted over a communications link, the receiving end is synchronized with the transmitting end to receive the digital signals.

The system can synchronize itself to the far-end connection by extracting the timing signal from the DS1's incoming digital stream. The 100D module passes the signal to the time division multiplex (TDM) bus for use by the system. The factory setting is that the first 1005 module in the control unit extracts the signal and provides primary synchronization.

If the system has more than one 100B module, you can assign the other module(s) to provide backup synchronization in the event of maintenance failure. You also can change the priority in which the modules provide synchronization by reassigning primary synchronization from Module 1 to either the second or third 100D module.

The source of clock synchronization is factory set to the external endpoint of the DS1 facility connected to Module 1 (loop clock reference source). For example, if the far-end of the DS1 facility is another communications system (PBX), your system synchronizes itself to that PBX clock. The factory setting can be changed to "local clock reference source," which means that the clock in your system is free running (not synchronized to the far-end of the DS1 facility). You must choose the clock synchronization source for all 100D modules in the system.

When the 100D module is used only to provide tie trunks to other communications systems, the two systems must be synchronized and one of the two systems will be the clock source for both.

If this system is the source, program "local clock reference," and then the far-end system will use your local clock for synchronization.

Be careful not to assign backup synchronization by other modules in your system in such a way that the system at the far-end of the tie trunk derives its clock signal source from an improper source. For example, if the module providing secondary synchronization is programmed for loop clock, it extracts the timing signal from its far-end connection. In a maintenance failure, that far-end clock will be used by your system and passed through the tie trunk to the system connected to Module 1. This is called a timing loop. (A timing loop exists if two systems derive their timing from each other, even if it passes through a third system).

Planning Form Instructions—Continued

Under "Priority" in the "Clock Synchronization" section of **Form 3c**:

9. If installing only one 100D module:
 - Check "Primary" to keep the factory setting. (This module provides synchronization for the system).
 - Check "None" if the synchronization source is other than through the 100D module.

Continue to Setp 11.

Planning Form Instructions—Continued

10. If installing more than one 100D Module, decide which Module, if any, provides the primary synchronization.
 - If Module 1 provides clock synchronization, check "Primary" in the first column (the factory setting).
 - If Module 2 (or Module 3) provides clock synchronization, check "Primary" in the column that describes that 100D module.
 - If the synchronization source is other than through a 100D module check "None".

If assigning backup synchronization:

- Check "Secondary" in the column that describes the 100D module providing secondary synchronization.
- Check "Tertiary" in the column that describes the 100D module providing tertiary backup.

11. Under the "Source" subheading in each column:

- Check "Loop" to retain the factory setting. The system uses the clock of the far-end connection.
- Check "Local" to change the setting. (Clock is free running).

12. Under the "Activation" subheading in each column:

- Check "Active" if loop clock synchronization is taking place.
- Check "Not Active" if the clock is free-running.

Note: Normally, the primary synchronization source is set to "active" and other modules are set to "not active".

Signaling Mode

Signaling is the process of communicating channel-state information (such as dialing) from endpoint to endpoint. Two types of signaling can be used in T1 transmission: robbed-bit signaling (RBS) and common-channel signaling (CCS).

Note: The signaling mode setting does not apply to ISDN-PRI.

- **Robbed-Bit Signaling.** RBS replaces ("robs") the least significant bit of every sixth frame of each DS0 channel with signaling information. (RBS is also called in-band signaling, since signaling information is embedded in the least significant bit of every sixth 8-bit word.)

RBS is appropriate for voice and voice-grade data, but facilities using RBS cannot accurately transmit digital data because digital data uses high-speed data rates such as 64 kbps. Therefore, the channel is limited to voice and analog voice-band data applications.

- **Common-Channel Signaling.** CCS is an 'out-of-band' signaling format that places the signaling bits for channels 1 through 23 into the 8-bit word of the 24th channel. The 24th channel, therefore, cannot be used for voice or data transmissions.

Planning Form Instructions—Continued

13. Under the "Signaling Mode" heading of **Form 3c**, in all the columns that describe T1 Modules:
- Check "RBS" to retain the factory setting of robbed-bit signaling.
 - Check "CCS" to change the factory setting to common-channel signaling.

**Channel Service Unit
Setting for T1 Emulation**

Use these instructions only if the 100D module type of service is T1 and outside lines are to be emulated.

For loop-start and ground-start emulation with T1, specify whether the type of equipment provided by the local telephone company central office is foreign exchange (the factory setting) or special access.

Planning Form Instructions—Continued

14. Under the "Channel Service Unit" heading of **Form 3c**, in all columns that describe T1 Modules used for emulation:
- Check "Foreign Exchange" to retain the factory setting.
 - Check "Special Access" to change the factory setting.

Primary Rate Interface Facility

Use these instructions only if the type of service on the DS1 facility is ISDN-PRI.

See System Reference for more detailed information.

Decide the following options for each ISDN-PRI facility:

- Telephone Number
- Telephone Number to Send
- Test Telephone Number
- Timers and Counters
- Terminal Equipment Identifier
- B-Channel Groups

Note: Because of the complexity of timer, counter, and terminal equipment identifier information, the factory settings for them should rarely be changed. Incorrect settings can have an adverse affect on the operation of ISDN-PRI facilities. Consult with your AT&T representative or authorized dealer when you plan options for PRI facilities.

Record your decisions about these options in the "ISDN-PRI Facility Options" section of Key System Form 3c (page 3). Make a copy of the form for each 100D module with an ISDN-PRI service type. Record the slot number (in the "Slot No." blank) at the top of the form(s).

Telephone Number

To allow the system to route calls to the correct destination, you can assign a telephone number consisting of up to 12 digits.

The factory setting is no telephone number is assigned. If you assign a telephone number to a channel, it must match the number that is dialed by the outside caller and sent to the system by the network. The numbers sent by the network are furnished by the ISDN-PRI service provider. The number you assign must also be unique within the same B-channel group and must be different from the associated test telephone number. B-channel groups and test telephone numbers are assigned later.

Planning Form Instructions

For all channels you plan to assign a telephone number:

1. Transfer the information from the "Line Type" column of **Key System Form 2c System Renumbering — Line Jacks** to **Form 3c**. Write the logical ID and the number in the applicable column.
2. Write the unique 12-digit telephone number furnished by the ISDN—PRI service provider in the "Telephone Number" column.

Telephone Number to Send

If your business subscribes to the AT&T INFO2 automatic number identification (ANI) service, you can assign the telephone number the system sends to the network when outgoing calls are made on ISDN-PRI facilities. If the person being called also subscribes to the same identification service, the telephone number sent identifies who is calling.

The factory setting is that no telephone number to send is assigned. If you assign a telephone number to send, it does not have to be unique since the number is used only for identification and not for routing. The number assigned can be up to 12 digits.

Note: The availability of the caller identification information may be limited by local-sewing (caller's) jurisdiction, availability, or central office equipment.

Planning Form Instructions

For all channels you plan to assign a telephone number to send:

1. If you have not done so already, transfer the information from the "Line Type" column of **Key System Form 2c, System Numbering — Line Jacks** to **Form 3c** on page 3. Write the logical ID and the line number in the applicable column.
2. Write the 12-digit telephone number that identifies your company as the caller in the "Telephone Number to Send" column on **Form 3c** on page 3.

Test Telephone Number

For each 100D module with an ISDN-PRI service type, you can assign a test telephone number that is used for maintenance by the service provider.

See "B-Channel Groups" later in this chapter.

The factory setting is that a test telephone number is not assigned. The number you assign must be the same number as that furnished by the ISDN-PRI service provider. When you assign a test telephone number, it must be different from the numbers assigned to other channels assigned to the same 6-channel group.

Planning Form Instructions

Next to the heading "Test Telephone Number" on page 3 of **Form 3c**, write the 12-digit test telephone number used for maintenance.

Terminal Equipment Identifier

The terminal equipment identifier (TEI) is used by the network to identify a piece of equipment connected to each D channel. Normally only one is connected, and the network assumes its terminal identifier is 0 (the factory setting). You can change the value to from 1 to 63.

CAUTION

Consult your AT&T representative or authorized dealer before changing the value. It is not likely that you will ever need to change the factory setting.

Planning Form Instructions

Under the "Terminal Equipment Identifier (TEI)" heading on **Form 3c**:

1. Check "0" to keep the factory-set TEI.
2. To change the factory-set TEI from 0, write a value from 1 to 63 in the space provided.

Timers and Counters

Timers and counters are used to ensure that the system takes the appropriate corrective action when no response is received from the network before the programmed settings have expired.

CAUTION

Since incorrect settings could have an adverse effect on the operation of ISDN-PRI facilities, consult your AT&T representative or authorized dealer before you make any changes. The factory-set thresholds are standard settings and should rarely be changed.

The timers and counters, descriptions, factory settings, and allowable thresholds are shown in Table 3-5.

Table 3-5 Timers and Counters

Name	Description	Factory Setting	Allowable Threshold
T200 Timer	Times the delay in link-layer acknowledgement of a message sent over a D channel from the system to the network.	1 second	100-3000 ms
T203 Timer	Times the interval of each exchange of messages on the D channel between the system and the network.	30 seconds	1-60 seconds
N200 Counter	Counts the times the system has transmitted a message on a D channel when no link-layer acknowledgement is received from the network.	3 transmissions	1-5 transmissions
N201 Counter	Counts the maximum number of layer-3 octets the system can send or receive in a single D-channel message.	260 octets	16-260 octets
K Counter	Counts the layer-3 unacknowledged messages sent on a D channel from the system to the network.	7 frames	1-15 frames
T303 Timer	Times the delay in network response when the system sends a setup message to initiate an outgoing call.	4 seconds	4-12 seconds
T305 Timer	Times the delay in network response when the system sends a disconnect message to clear a call.	4 seconds	4-30 seconds
T308 Timer	Times the delay in network response when the system sends a release message to clear a call.	4 seconds	4-12 seconds
T309 Timer	Times the duration of a D-channel data-link failure, which consists of a loss of signaling for the entire PRI connection.	90 seconds	30-120 seconds
T310 Timer	Times the network delay following the receipt of a call-proceeding message on an outgoing call.	10 seconds	2-10 seconds
T313 Timer	Times the delay in network response when the system sends a connect message that indicates the completion of an incoming call.	4 seconds	4-12 seconds
T316 Timer	Times the delay in network response when the system sends a restart message to clear a B channel.	120 seconds	3-120 seconds

Planning Form Instructions

Under the "Timers and Counters" heading on **Form 3c**:

1. To change the factory setting for any timer or counter, write the new threshold in the "Change To" column.
2. To keep the factory setting, leave the "Change To" column blank.

B-Channel Groups

To make the most effective use of ISDN-PRI service, assign B channels (channels 1 through 23) to groups. Once you establish B-channel groups, you can associate the channels used for ISDN service so that calls can be placed and received on the associated B channels.

Up to 69 B-channel groups can be established. Each B channel, and channels used for ISDN service, can be assigned to only one group. Each group can contain up to 23 channels, and all channels within each group must signal through the same D channel (connected to the same 100D module).

Assign B channels in the order that the system should search for an available channel. To minimize call attempts on the same channel, the best arrangement is the opposite order of the hunting arrangement furnished by the ISDN-PRI service provider.

Since B channels are not associated with any line number or logical ID, they can be identified only by use of the control unit slot and port number.

Planning Form Instructions

Determine which channels to group and record each group on **Form 3c, page 4, "B-Channel Groups"**.

Note: Page 4 holds the programming information for two B-channel groups. Duplicate the form if more groups are planned.

In each column:

1. Write the group number (1-69) next to the "Group No." heading. Start with 1 and number sequentially.
2. Write the slot and port number of each B-channel assigned to the group (Refer to the "Control Unit Diagram" on **Form 1**).

When programmed for ISDN-PRI, the single DS1 Jack on the 100D module supports 23 channels or ports. (the 24th channel transmits signaling mode information). To determine the port number, assume that port 1 is at the bottom of the module to which you are assigning B-channels.

Note: If you have completed the "Non-Complex Configuration" pages of **Form 3c**, transfer the slot and channel (port) information from those pages.

Planning Form Instructions—Continued

For all channels you plan to associate with the group:

3. Transfer the information from the **Key System Form 2c, System Numbering — Line Jacks** to **Form 3c**. Write the logical ID and number in the applicable column.

T1/ISDN-PRI Planner

To ensure compatibility with your system, all local offerings of DS1 configurations must be reviewed by AT&T National Technical Marketing (NTM) personnel. This review begins when NTM receives the "General Business Systems T1/ISDN-PRI Planner" (**pages 5 through 7 of Key System Form 3c**).

Planning Form Instructions

On **page 5** of **Form 3c**:

1. Fill in the customer name, telephone number, and address.
Note: "Reference Number" is used by NTM.
2. Fill in the AT&T DOSS Order Number.
3. Identify the AT&T personnel handling the account. Account Executives name and telephone number and the System Consultant's name and telephone number.
4. Identify the DS1 facility provider by writing the provider's name in the "T1/ISDN-PRI Vendor" space along with the contact person's name and telephone number.
5. Under the "Installation" heading:
 - Write the date the installation is due to be complete.
 - Write the date the equipment is scheduled for delivery to your company next to "Materials-on-Job Date".

Under the "AT&T Installation Contacts" heading:

6. List the names and telephone numbers of the AT&T personnel responsible for the equipment order and the installation; the Order Implementor, the National Technical Marketing (NTM) Manager, the National Technical Service Center (NTSC) Engineer, and the Data Services Organization (DSO) Manager.
7. Under the question about whether the order has been placed with the DS1 Facility Vendor:
 - Check "Yes" if the order has been made and fill in the date.
 - Check "No" if the order has not been placed.

Planning Form Instructions—Continued

8. On **page 6** of **Form 3c**, Complete one block for each 100D module.

Transfer the options information for each module from the corresponding column of **page 1** of **Form 3c**.

- Service Ordered or Planned (Type of Service)
- Frame Format.
- Line Coding (Supression).
- Line Signaling Mode.
- Synchronization Timing (Clock Synchronization: Source).

An important part of the NTM review is to ensure that the synchronization integrity of the network—both this communications system and its far-end connections—is protected. To facilitate their evaluation, prepare the Network Planning Map on **page 7** of **Form 3c**. Describe the entire network of DS1 facilities by summarizing the following for each 100D module:

- CSU used
- distance between the control unit and CSU or far-end connection
- types of facilities or services connected to each 100D module
- clock synchronization source

As an example, the system described in Figure 3-2 shows a large processor module system with two 100D modules.

The communications system in Figure 3-2 is configured as follows:

- Module 1 in slot 04 is connected to a model ESF-T1 CSU that is approximately 100 cable feet from the control unit. (The DS1 facility is connected to the ISDN-PRI network.)
- Module 2 in slot 05 is connected to a 551-T1 L1 CSU that is approximately 160 cable feet from the control unit. (The far-end is another communications system.)
- The primary clock synchronization source is the ISDN-PRI network connected to Module 1. Its path is shown by a line and the letter P.
Note: The dotted line between the control unit and the PBX in Connection 2 indicates that the PBX derives its timing signal from your system.
- The secondary clock synchronization path, shown by a line and the letter S, is the system internal clock.

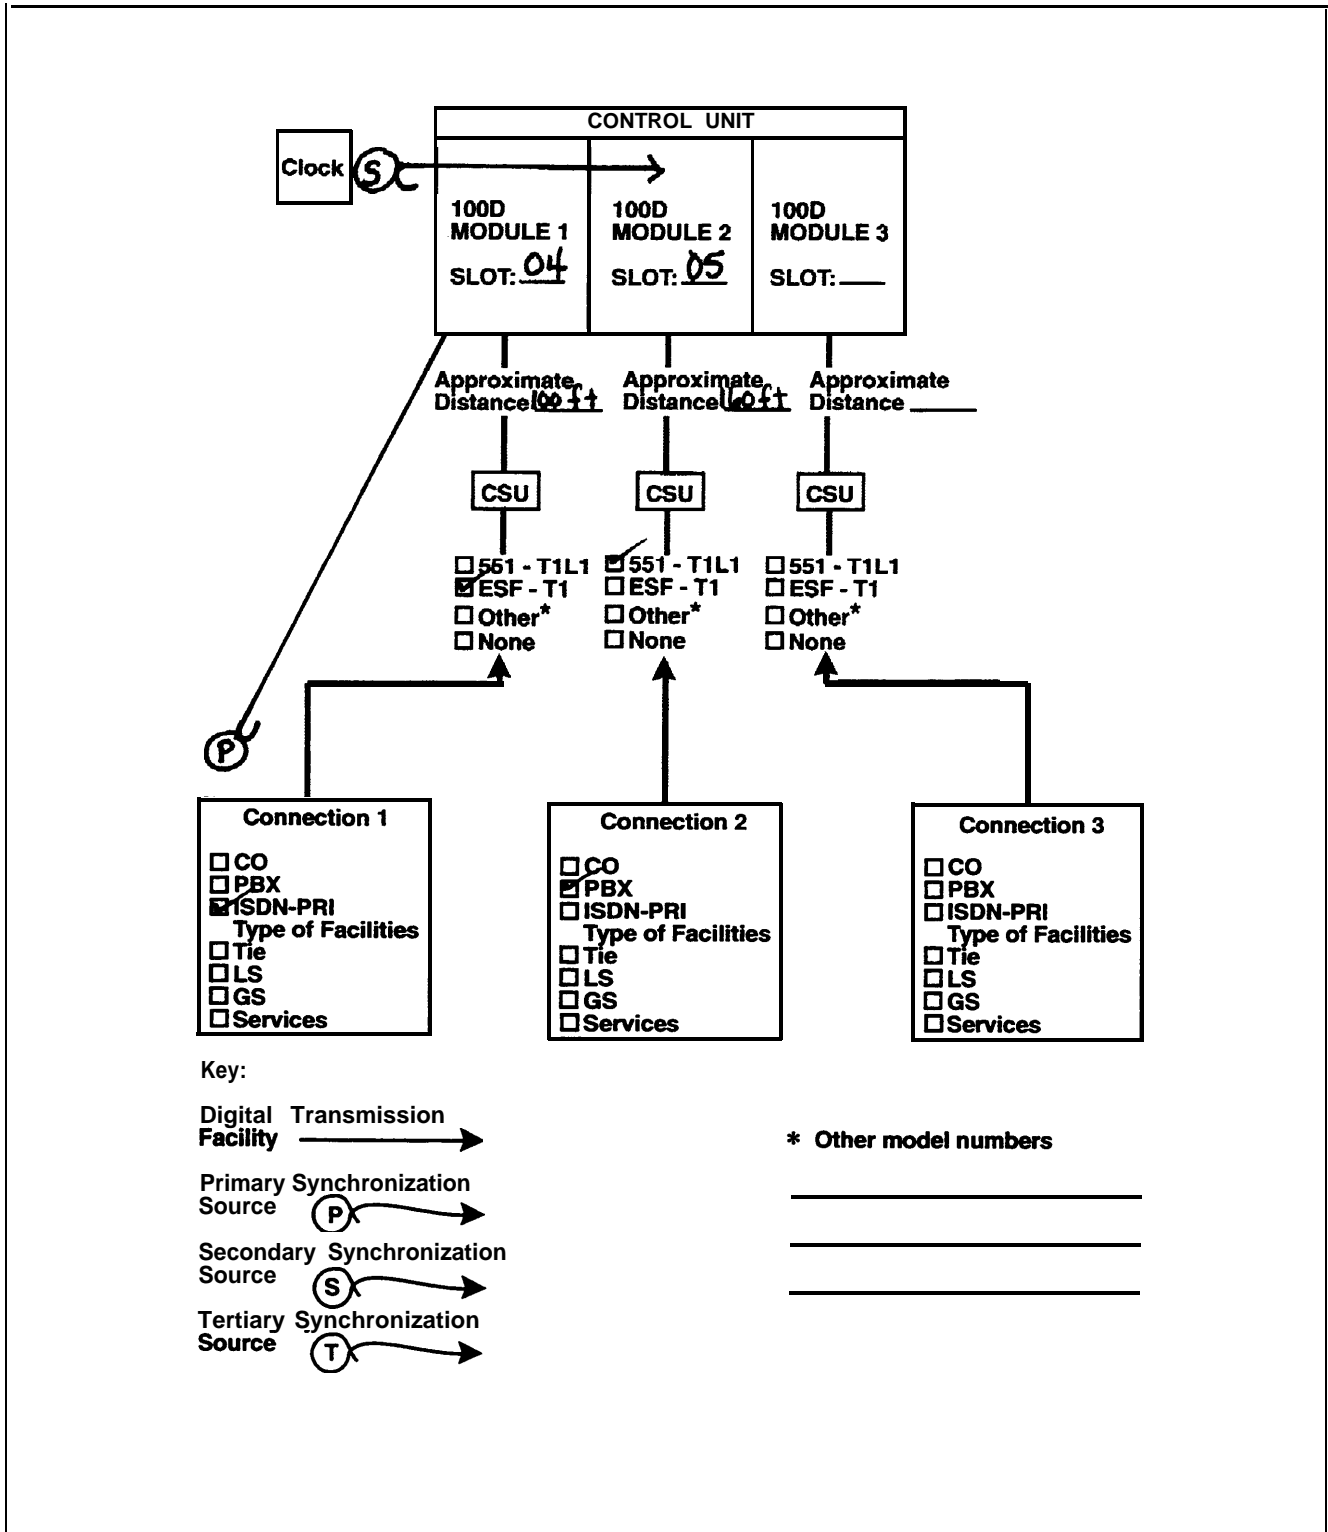

Figure 3-2 Sample Network Planning Map

Planning Form Instructions

On the "Network Planning Map" (**Page 7 of Form 3c**):

1. Fill in the control unit slot number(s) of the CSU(s) connected to the 100D module(s).
2. Write the approximate number of cable feet between each module and its CSU or far-end connection (Refer to "Line Compensation" on **page 1**).
3. Check the Module number(s) of the CSU(s).
 - If "Other", write the manufacturers name and model number.
 - If no CSU is needed, check "None".
4. In the connection block(s), describe the DS1's far-end connection.
 - Check "CO" if the connected to the telephone company central office.
 - Check "PBX" if connected to another communications system.
 - Check "ISDN-PRI" if connected to the ISDN-PRI network.
 - Check the type(s) of emulated lines if the facility's type of service is T1. Also check "Services" if the facility includes services such as MultiQuest with DNIS.
5. Describe the clock synchronization sources according to the key at the lower left of the map.
 - Draw a circle and line from the clock source to the appropriate 100D module.
 - Label the circle "P" for Primary, "S" for Secondary, and "T" for Tertiary.
6. Make a copy of the "General Business Systems T1/ISDN-PRI Planner" (**pages 5-7 of Form 3c**) for your records and forward the original to AT&T National Technical Marketing (NTM).

NTM also evaluates the complexity of the facility configuration requested. Examples of complex configurations are connections into key networking applications, connections to multiplexing arrangements, or applications that involve customer engineering or design.

- If an order is considered complex, NTM directs you to the Business Communications System (BCS) National Engineering Center (NEC).
- If NTM notifies you that the order's configuration is not complex, Tier III General Business System (GBS) National Technical Service Center (NTSC) is authorized to approve the configuration.

The NTSC group's pre-authorization review is based, in part, on information you provide to them. Specifically, you must send them.

- a copy of the planner (**pages 5 through 7 of Key System Form 3c**)
- a completed "Non-Complex Configuration" sheet (**pages 9 through 11 of Form 3c**) for each 100D module you plan to install.

Planning Form Instructions

Complete one "Non-Complex Configuration" page of **Form 3c** for each module. Label the top right corner of the copies "Page 1 of (1, 2, or 3)".

On each page:

1. Write the module number (1, 2, or 3). Indicate the total number of 100D modules (maximum of 3 per large system).
2. Fill in the control unit slot number. (Refer to **page 1 of Form 3c.**)

In the "Services" section:

3. Check the box next to each emulated line or service that will be connected. Check only those services allowed on the type of service (T1 or ISDN-PRI) selected for the module.
4. Circle the channel(s) to which each emulated line or service will be assigned.

Note: No channel should show more than one line or service assigned to it, and the 24th channel cannot be used if the signalling type is common channel.

If the type of service is ISDN-PRI, complete the "ISDN-PRI Identification Service" section.

5. Do *one* of the following:

- Check the "No" box if you are not planning to use the number identification service. Continue to step 7.
- Check the "Yes for", box if you are planning to use the identification services and check the service planned:
 - For incoming calls, check "ANI", "SID," or "Both." If both automatic and station identification service are planned, indicate the order in which the information should be displayed (ANI then SID or SID then ANI).
 - For outgoing calls, check either "ANI" or "SID" to indicate the service planned.
 - If you are planning to prevent sending out your own caller identification information, check the box labeled "SID/ANI Privacy."

Note: The availability of the caller identification information may be limited by local-serving (caller's) jurisdiction, availability, or central office equipment.

In the "Channel Service Unit" section:

6. Check the box that describes the channel service unit used. If you are not using one of the two AT&T models, check the third box and write in the manufacturer information that describes the unit.

Planning Form Instructions—Continued

7. Forward all copies of this page along with a copy of the "Central Business Systems T1/ISDN-PRI Planner" (from **page 5-7 of Form 3**) to Tier III, General Business Systems, National Technical Service Center.

DS1 Facilities Ordering Discussion

After the contract is signed, your AT&T representative or authorized dealer contacts the DS1 facility vendor to discuss the T1/ISDN-PRI service order. The vendor needs information about the communications system as well as customer identification.

Table 3-6 describes the kind of information the facilities vendor requires. Review this table with your network representative or dealer so that you will be familiar with the details of the DS1 facilities order.

Table 3-6 Guide to DS1 Facilities Ordering

See Your AT&T representative or authorized dealer for the current release and version number of the system.

Communication System			
Manufacturer	AT&T		
Model	MERLIN LEGEND		
Type (Mode)	digital Key

Tie Trunks

Use these instructions only if the system has tie trunks, including tie trunks emulated through a DS1 facility.

Tie trunks are private lines between your system and the central office or between two communications systems—for example, between this system and another system of the same type, or this system and a System 25 or a System 75.

Tie trunks must be configured to match central office requirements or the configuration of the system to which they tie. Review tie trunk operation with your AT&T representative or authorized dealer and make the following decisions about the way each tie trunk operates:

- Direction
- Signaling Type
- Dial Mode
- Dial Tone
- Answer Supervision Time
- Disconnect Time

Mark each tie-trunk configuration on Key System Form 3d, Outside Lines — Tie.

Planning Form Instructions

Transfer the line identification from **Key System Form 2c, System Numbering — Line Jacks to Form 3d**. Write the logical ID and line number for each trunk connected to the system.

Direction

Decide if the tie trunks will send telephone calls one way or two ways (the factory setting).

Two-way is preferable if you anticipate light call traffic; one-way is preferable if you anticipate heavy call traffic. Two-way in heavy call traffic increases the chance of users on both ends of a two-way tie trunk trying to use it at the same time, in which case neither call will go through.

If you choose one-way, also decide if the direction will be out or in. For example, if users need only to receive information from another location but do not need to return calls, an incoming tie trunk would be sufficient.

Planning Form Instructions

Under the "Direction" heading on **Form 3d**, Check the direction for each tie trunk next to its line number.

- Check the factory-set "Two-Way" column if the trunk is two-way.
- Check either "Outgoing" or "Incoming" for each one-way tie trunk.

Signaling Type

The choices for signaling type (also called seizure type) are wink, delay, immediate, and automatic. Of the four types, wink, delay, and immediate are similar in that they allow users to call people in the other system by dialing their extensions. With the automatic type, no dialing is needed: users call an operator who then transfers the call to the proper person.

Choose the same type as that used by the system to which you are connecting. For incoming-only or two-way tie trunks, the incoming type must be the same as the outgoing type of the remote system. For outgoing-only or two-way tie trunks, the outgoing type must be the same as the incoming type of the remote system.

Wink is the factory setting, and if available, it is the preferred type, followed by delay and then immediate.

See "Dial Mode" later in this chapter.

Note: Immediate does not work with the touch-tone dial mode.

See "DS1 Facility" earlier in this chapter and "Line Assignment" later in this chapter.

For T1 facilities used for services (for example, Megacom), consider the direction of the tie trunk and how trunk assignments will be made and select from the following:

- **One-way, outgoing tie trunks.** Tie trunks are not assigned to Personal Line buttons on telephones. Select wink signaling.
- **One-way, outgoing tie trunks.** Tie trunks are assigned to Personal Line buttons on telephones. Select immediate signaling.
- **One-way, incoming tie trunks.** Dialed Number Identification Service (DNIS) is included. Select wink signaling.
- **One-way, incoming tie trunks.** DNIS is not included. Select automatic signaling.

Planning Form Instructions

Under the "Signaling Type" heading on **Form 3d**, check either "In" or "Out" under the "Wink", "Delay", "Immediate", or "Automatic" for each tie trunk.

E&M Signal

Select one of the following signaling types to be used on the tie trunks:

- Select type 1S (the factory setting) if the tie trunks are connected to the other system through the local telephone company.
- Select type 1C if the tie trunks are connected directly to a system that uses type 1S signaling and is located near this system.
- Select type 5 if the tie trunks are connected directly to a system that uses type 5 signaling and is located near this system.

Planning Form Instructions

Under the "E&M Signal" heading on **Form 3d**, check your choice of signal type for each tie trunk.

Dial Mode

Choose an incoming (inmode) and outgoing (outmode) dial mode, either touch-tone or rotary. For two-way tie trunks, you must choose a dial mode for incoming and outgoing. The system is factory set for rotary for both directions.

Note: If you have checked "Incoming" for a tie trunk's direction and "Immediate" for its signaling type, you cannot have touch-tone mode.

Planning Form Instructions

On **Form 3d**:

1. Under the "Inmode" heading, check either "Touch-Tone" or "Rotary" for each incoming-only and each two-way tie trunk.

Note: If you have checked "Incoming" for a tie-trunk's direction and "Immediate" for its type, you cannot have a touch-tone mode.

2. Under the "Outmode" heading, check either "Touch-Tone" or "Rotary" for each outgoing-only and each two-way tie trunk.

Dial Tone

Decide if the system will provide a dial tone for users calling in on the tie trunk. The remote setting (the factory setting) causes the system to produce a dial tone. The local setting does not produce a dial tone.

Planning Form Instructions

Under the "Dial Tone" heading on **Form 3d**, check either "Remote" or "Local" for each tie trunk.

Answer Supervision Time

The answer supervision time is factory set at 300 milliseconds (ins). If the system needs a different setting, change the time to between 20 and 4800 ms. Use 20-ms increments.

Planning Form Instructions

Under the "Answer Supv. Time" heading on **Form 3d**, check "300" to keep the factory settings or write the new value (20-4800 ms) in the "Other" column.

Disconnect Time

The disconnect time is factory set at 300 ms. If the system needs a different setting, change the time to between 140 and 2400 ms. Use 10-ms increments.

Planning Form Instructions

Under the "Disconnect Time" heading on **Form 3d**, check "300" to keep the factory setting, or write the new value (140-2400 ms) in the "Other" column.

Line Assignment

Follow the instructions in the Data Guide to assign lines to data stations.

Use these instructions to assign lines to telephones and direct-line consoles.

There are five different forms for recording line assignments. Prepare one copy of the appropriate form for each station.

- Key System Form 4a, Analog Multiline Telephone
- Key System Form 4b, Digital/ISDN (MLX) Telephone the (front for the telephone and the back for an adjunct connected using a Multi-Function Module)
- Key System Form 4c, Tip/Ring Equipment
- Key System Form 5a, Direct-Line Console (DLC)—Analog
- Key System Form 5b, Direct-Line Console (DLC)—Digital/ISDN (the front for the telephone and the back for an adjunct connected-using a Multi-Function Module)

Planning Form Instructions

On the front of **Form 4a** through **5b**:

- 1 . Transfer the user identification from **Key System Form 2a, System Numbering — Station Jacks** to each copy of all telephone forms.
 - Write the logical ID in the "Logical ID" space.
 - Write the extension number in the "Extension No." space.
 - Write the name of the person or location of the equipment in the "Person or Location" space.

On the Reverse side of **Form 4a** and **Form 5b**:

- 2 . Fill in the user identification from the **Key System Form 2b, System Numbering — Digital/ISDN Station Adjuncts** for any adjuncts connected to an MLX telephone using an MFM.
 - Write the extension number in the "Extension No." space.
 - Write the name of the person or the location of the equipment in the "Person or Location" space.
- 3 . Locate any "voice/voice" or "voice/data" entries in the "Person or Location" column of **Form 2a**. Under the "Station Jack Pair" heading on **Form 4a** and **5a**:
 - Check the "Voice Announce to Busy" box or the "Simultaneous Voice and Data" box to indicate the type of station jack pairs.
 - Enter the logical ID and extension number under the "Even-numbered jack" heading.

Planning Form Instructions

4. Identify the equipment at each station (Refer to the **Floor Plan**).
 - Check the box that describes the telephone, console module, or type of tip/ring equipment.
 - Check the box under "Adjuncts" that describes the adjuncts at the station.

Note: Checking the "Data Terminal" box is informational only, See the *Data Guide*.

Telephones

See Chapter 4 of System Reference for additional information on modes and line assignments.

The line buttons you can assign to telephones or adjuncts connected through an MLX telephone using an MFM are:

- Key and Behind Switch Modes
- Key Mode only
- Behind Switch Mode only

Key and Behind Switch Modes

- **Intercom Ring button** - used to make and receive inside and outside calls. When used to make inside calls, the called person hears one long ring to indicate an inside call. The system automatically assigns this type of button to all telephones.
- **Intercom Voice button** - used to make and receive inside and outside calls. When used to make inside calls, the called person hears the caller's voice. The system automatically assigns this type of button to all multiline telephones and MFMs.
- **Intercom Originate Only button** - used only to make inside and outside calls. Calls are not received on this button, which ensures that the user always has a button available to make calls. The button can be set to either voice or ring operation for inside calls.
- **Loudspeaker Page button** - used to make announcements over an optional loudspeaker paging system. To make a loudspeaker announcement, the user simply selects the Loudspeaker Page button, then speaks into the handset. The user does not need to dial the extension number for the loudspeaker paging system.

Key Mode Only

Personal Line button - used to dedicate an outside line for use by particular telephones in the system. The Personal Line button is used to make and receive only outside calls and the line can appear on more than one telephone (up to a maximum of 64 stations).

Behind Switch Mode Only

Prime Line button - used to access the host system's pool of outside lines. To call another person connected to the host system, the user dials the host system extension number assigned to that person. To access outside lines, the user dials a dial-out code (usually a 9), and the host system selects an available outside line from its pool.

The system is factory set to assign certain kinds of line buttons depending on the type of equipment and the mode of operation:

- In the Key mode, the system assigns an IntercomRing button, an Intercom Voice button, and the first eight outside lines connected to the control unit to every non-operator multiline telephone
- In the Behind Switch mode, the system assigns an Intercom Voice button, and Intercom Ring button and one Prime Line button to every non-operator multiline telephone.
- For either mode, the line assignment is the same for both analog and digital/ISDN (MLX) telephones.

See Figures 3-3 and 3-4.

Figure 3-3 Factory-Set Assignment, Digital/ISDN (MLX) Telephones

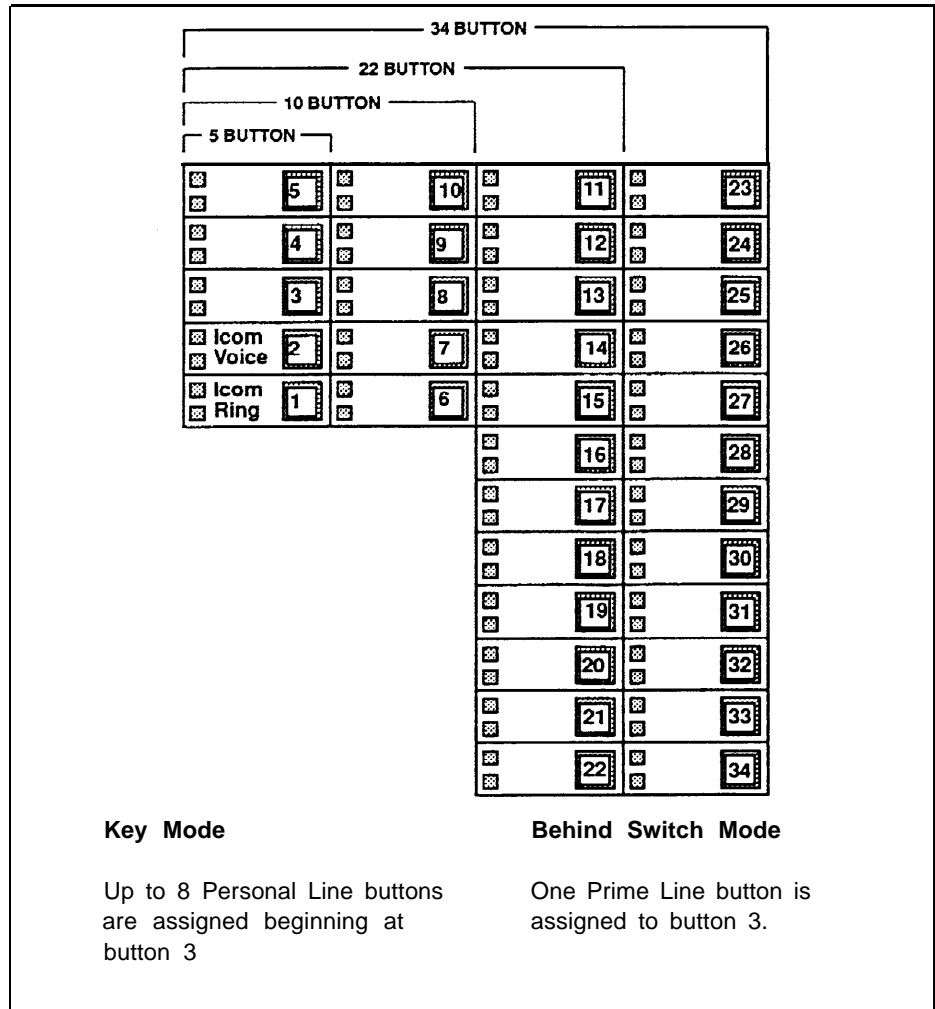

Figure 3-4 Factory-Set Assignment, Analog Multiline Telephones

Although equipment such as single-line telephones, answering machines, and fax machines do not have buttons, the system treats them as multiline telephones with 34 buttons.

In both the Key and Behind Switch modes, the system assigns no outside lines to this type of equipment. The system assigns two Intercom Ring buttons to every adjuncts, connected through an MFM to an MLX multiline telephone and to equipment connected to a 012 or 008 OPT module.

Consider the following information as you assign lines to each telephone.

Key Mode

For multiline telephone users:

- You can assign a combination of up to 10 Intercom Voice, Intercom Ring, or Intercom Originate Only buttons to each station (excluding operator positions).
- Assign additional Intercom Ring, Intercom Voice, or an Intercom Originate Only button for people who frequently receive or make transferred calls. The Intercom Originate Only button ensures that if a user is busy on a call, at least one additional button is available to receive another call and another is available to make a call.
- Assign additional outside lines, including special-purpose lines such as WATS or FX
- Remove or rearrange the eight factory-set outside-line assignments
- If you want the station user to receive outside calls on a specific line, assign a personal line to a button on the telephone or adjunct. The station user is automatically connected to the intercom when the receiver is lifted, and the user can select an outside line by dialing the Idle Line Preference Code (usually a 9).
- Consider assigning a Loudspeaker Page button to make announcements over an optional loudspeaker connected to the control unit. To make an announcement, users press the button and speak into the handset. They do not need to dial the extension of the loudspeaker paging system.

For single-line telephone users, answering machines, fax machines, or any other device connected to a 012 or 008 OPT module or an MFM:

- You can assign a combination of up to 10 Intercom Voice, Intercom Ring, or Intercom Originate Only buttons to each station. (At least one Intercom button must be assigned to each single-line telephone or adjunct connected to an MLX telephone using an MFM.)
- You want the station user to receive outside calls on a specific line, assign a personal line to a button on the telephone or adjunct. The station user is automatically connected to the intercom when the receiver is lifted, and the user can select an outside line by dialing the Idle Line Preference Code (usually a 9).

Behind Switch Mode

For multiline telephone users, consider assigning

- additional prime lines
- any outside lines connected directly to the control unit, including special-purpose lines
- a Loudspeaker Page button to make announcements over an optional loudspeaker connected to the control unit. To make an announcement, users press the button and speak into the handset. They do not need to dial the extension of the loudspeaker paging system.

For single-line telephone users, answering machines, fax machines, or any other device connected to a 012 or 008 OPT module or an MFM consider assigning

- additional prime lines
- any outside lines connected directly to the control unit, including special-purpose lines

Single-line telephones can be programmed to select only the prime line (the user cannot make inside calls or use system features) or to select the intercom button followed by the prime line or outside line (the user can place and receive inside calls and use system features).

See System Programming for instructions.

Note: For adjuncts connected using an MFM, it's recommended that you change the button 2 assignment to Intercom Originate Only and remove the button 3 assignment (in both Key and Behind Switch modes).

Planning Form Instructions

Complete the "Button Diagram" section of each copy of **Forms 4a, 4b** (front and back), **4c**, and **5b** (back only).

Note: The button diagrams for DLCs (the back of **Form 5a** and the front of **Form 5b**) will be completed later.

To leave the factory-set assignments:

1. For multiline telephones in the Key Mode, fill in the telephone numbers on buttons 3 through 10. For future reference, also record the line numbers. (Refer to **Form 2c**).
2. For multiline telephones in the Behind Switch Mode, fill in the extension number of the prime line on the button numbered "3".

To change the factory set assignments:

1. Show the type of intercom buttons on buttons 1 through 10 by writing "Icom, Voice", "Icom Ring", or "Icom Originate Only".
2. Fill in the telephone numbers (or prime-line extension numbers) to be assigned or changed. Start with the button numbered "3" and for future reference, record the line numbers on the diagram. (Refer to **Form 2c**).
3. Assign Loudspeaker Page buttons by selecting the button and writing "Page" on it.

Direct-Line Consoles

Use these instructions only if the system has one or more direct-line consoles.

See the Direct-Line Consoles Operator's Guides for more on DLCs.

The line buttons automatically assigned to DLCs are different from those on other telephones. In typical systems, DLC operators are responsible for handling all incoming calls. Therefore, the factory setting for DLCs is that, in addition to a Intercom Voice and a Intercom Ring button, as many lines as possible are assigned to each console. Each line appears on a separate button, which means that the number of lines assigned is limited to the number of buttons on the console (up to a maximum of 32 on the 34-button analog DLC).

The system also assigns a Direct Station Selector (DSS) button for each extension number associated with a station and special-feature buttons that are used by the DLC operator for call handling.

The number of line, DSS, and feature buttons assigned depends on the type of telephone and the number of lines connected to the system.

Figures 3-5 and 3-6 show initial line and feature assignments for digital/ISDN (MLX) and analog DLC consoles. See the appropriate figure as you decide line assignments for DLCs.

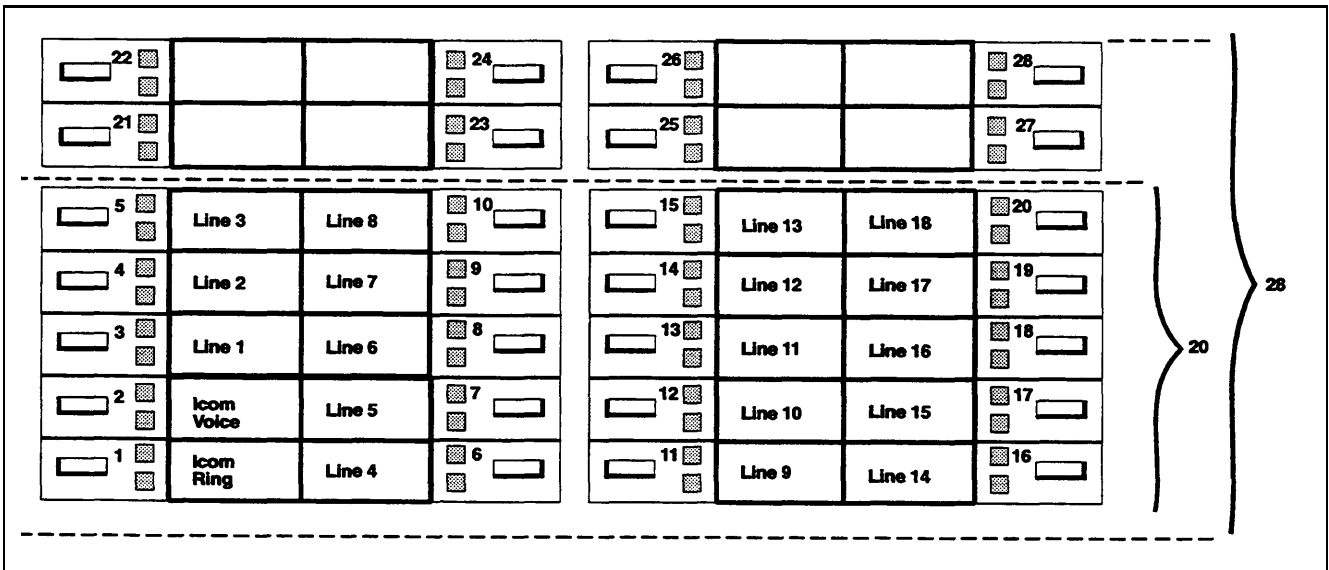

Figure 3-5 Digital/ISDN (MLX) DLC

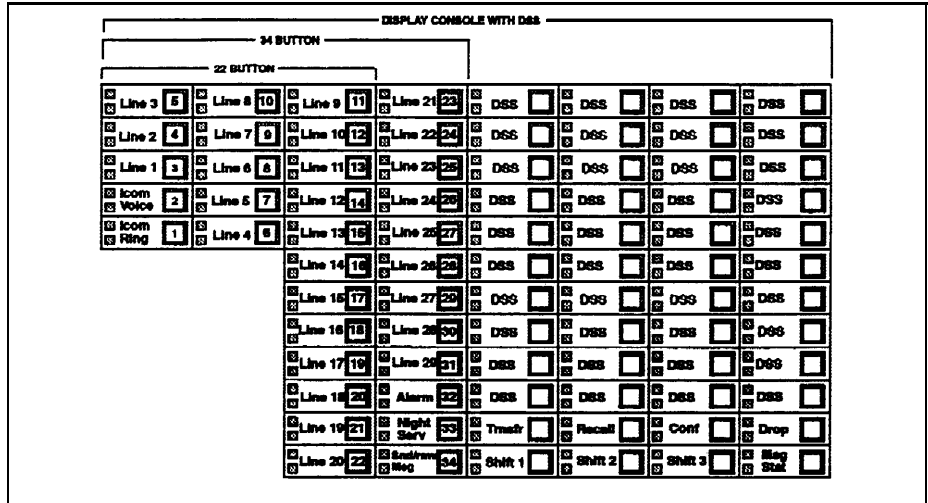

Figure 3-6 Analog Multiline DLC

The system assigns lines to buttons on DLCs in the order in which the lines are connected to the control unit. You can change the factory-set assignments by removing, adding, or changing the order in which lines are assigned to buttons for each DLC operator.

If the system has more than the number of lines factory assigned to operator consoles, be sure to change the line assignment so that all lines you want answered by a DLC operator appear on at least one operator position.

Decide which lines should appear on each DLC operator console based on each operator's call-handling responsibilities. All operators may not need the same assignments. For example, DLC operators responsible for answering all incoming calls usually need all lines except, perhaps, personal lines. DLC operators who are responsible for answering calls for specific groups usually need only the lines used by group members.

If the system includes a loudspeaker paging system, consider assigning a Loudspeaker Page button to DLC positions for one-touch access to the paging equipment.

If the system has fewer than 30 lines, the operator-only features Alarm, Night Service and Send/Remove Message are factory assigned as shown in Figure 3-6. The factory assignments can be changed through centralized telephone programming or by a DLC operator.

Planning Form Instructions

Complete the "Button Diagram" on each copy on the back of **Form 5a** and the front of **Form 5b**.

1. Write the telephone number of the line you want to assign in the space on the "Button Diagram". For future reference, record each line's number. (Refer to **Form 2c**).
2. Assign Alarm, Night Service, or Send/Remove Message buttons by labeling the appropriate button "Alarm", "Nite Serv.", or "Send/Rem Msg."
3. Assign Loudspeaker Page buttons by selecting the button and write "Page" on it.

Features

4

The MERLIN LEGEND Communications System offers these optional features:

- **Telephone Features** — assigned to individual telephones, consoles, or adjuncts
- **Operator Features** — assigned to all operator consoles
- **Group Assigned Features** — apply to functional groups of users (such as separate departments)
- **System Features** — affect all or most of the users

Telephone Features

Instructions for assigning these features to the individual telephones used by both system operators and general users are:

- Call Restrictions
- Forced Account Code Entry
- Microphone Operation
- Remote Call Forward
- Fax Message Waiting Receiver and Threshold

See System Reference for a complete list of features.

Additional telephone features can be programmed by each user or by centralized telephone programming. You can decide which telephones should have these features, or you can let users program their own telephones with the features they want.

Mark the feature assignments under “Optional Features” on the copies of the forms you used to assign lines:

- Key System Form 4a, Analog Multiline Telephone
- Key System Form 4b, Digital/ISDN (MLX) Telephone (the front for the telephone and the back for an adjunct connected using a Multi-Function Module)

- Key System Form 4c, Tip/Ring Equipment
- Key System Form 5a, Direct-Line Console (DLC) — Analog
- Key System Form 5b, Direct-Line Console (DLC) — Digital/ISDN (the front for the console and the back for an adjunct connected using a Multi-Function Module)

Call Restrictions

When the system is set up, users can place local and toll calls from all telephones. You can restrict selected telephones from making outside calls and allow only intercom (inside) calls—for example, telephones in a reception area or break room. Or, to control toll abuse, you can restrict telephones from making toll calls but still allow local and intercom calls.

See "Allowed Lists" and "Disallowed Lists" later in this chapter for more information.

If these restrictions are too limited, you can use the Allowed List feature to permit dialing numbers such as emergency numbers from a restricted telephone. Or, instead of restricting telephones, you can use the Disallowed List feature to prevent dialing numbers (such as "900" numbers) from any telephone.

Planning Form Instructions

Under the "Call Restriction" heading of **Forms 4a** through **5b**:

1. Check "Unrestricted" to keep the factory setting (intercom, local, and toll calls can be placed).
2. Check "Outward Restrict" to restrict the telephone from making outside calls (only intercom calls can be made).
3. Check "Toll Restrict" to restrict the telephone from making toll calls (intercom and local calls can be made).

See "Delay Announcement" later in this chapter.

Forced Account Code Entry

Forced Account Code Entry, requiring users to enter account codes (1 to 16 digits) before making outside calls, is used to associate calls with corresponding accounts, clients, or projects, or to track personal calls. Incoming calls can be tracked with account codes, but you can neither "force" users to enter them nor verify them for accuracy.

Planning Form Instructions

Under the "Forced Account Code Entry" heading on **Forms 4a** through **5b**:

1. Check "No" if you do not want the feature assigned to the telephone.
2. Check "Yes" to require the user to enter an account code.

Microphone Operation

The microphone on MLX telephones and analog multiline telephones allows users to have conversations through a speakerphone without lifting the handset. You can disable the microphone on MLX telephones (but not on analog multiline telephones) in areas in which use of the speakerphone is disruptive.

Planning Form Instructions

Under the "Microphone Operation" heading on **Forms 4b** and **5b**:

1. Check "Enable" to keep factory setting.
2. Check "Disable" to prevent speakerphone use.

Remote Call Forward

When the system is set up, it does not allow users to forward calls to outside numbers. Remote Call Forward provides this feature for selected telephones; for example, for users who often work away from the office. Calls forwarded to locations outside the system may vary in transmission quality.

If the telephone has a personal line assigned, you can specify that incoming calls on that line also can be forwarded to an outside number by assigning the telephone as the principal user of the personal line.

See "Coverage" later in this chapter.

Note: When a principal user is assigned, calls received on the personal line are also sent to individual or group coverage receivers unless the personal line button is set for no ring.

Planning Form Instructions

Under the "Remote Call Forward" heading on **Forms 4a** through **5b**:

1. Check "Not Allowed" to keep the factory setting.
2. Check "Allowed" to provide Remote Call Forward.

Under the "Principal User of Personal Line" heading:

3. Write the line number and telephone number in the spaces provided if you want the person to forward calls on the personal line to a remote number. (Refer to **Key System Form 2c**, **System Numbering — Line Jacks**).

Fax Message Waiting Receiver and Threshold

Use these instructions only if the system has fax machines connected directly to the control unit via a 008 OPT or 012 module or connected to an MLX telephone using a Multi-Function Module (MFM). These instructions are not applicable to fax machines connected to an analog multiline telephone using a General Purpose Adaptor (GPA).

Fax Message Waiting Receiver allows you to designate from one to four telephones to receive message-waiting indications when a fax is received on a specific fax machine. Fax machines can only send message-waiting indications; they cannot receive message-waiting indications from other fax machines.

You can specify the Fax Message Threshold, which is the length of time (0-30 seconds) before the system assumes a fax has arrived and sends the message-waiting indication. The factory setting is 10 seconds.

Planning Form Instructions

For Fax machines connected to a 008 OPT or 012 Module, use **Key System Form 4c, Tip/Ring Equipment**.

For Fax machines connected to an MLX telephone using MFM, use the back of **Key System Form 4b, Digital/ISDN (MLX) Telephone** or **Key System Form 5b, Direct-Line Console (DLC) — Digital/ISDN**.

In the "Fax Machine Features" section, under the "Fax Machine Receiver" heading:

1. Check "No" if you are not assigning a receiver and continue to the "Operator Features" instructions.
2. Check the second box to assign a Message Waiting Receiver. Write the extension number of the telephone acting as the receiver in the space provided. (Refer to **Form 2a, System Numbering — Station Jacks**).

Under the "Fax Message Threshold" heading:

3. Check "10 seconds" to keep the factory set threshold.
4. Check the second box to change the factory set threshold. Write the number of seconds in the space provided.

Locate copies of **Forms 4a** through **5b** that describe specific telephone(s) designated as receiver(s) of Fax message-waiting indications.

Under the "Message-Waiting Receiver" heading:

5. Write the extension number of the Fax machine that sends a message waiting indication to the telephone.

Note: You will fill in the rest of the optional telephone features later.

Operator Features

Operator features apply only to direct-line consoles (DLCs) and any Direct Station Selectors (DSSs) connected to them. Operator features you assign apply to all DLCs in the system.

Mark the operator feature assignments on Key System Form 6a, Optional Operator Features.

Direct-Line Console

Use these instructions only if the system has one or more DLCs.

There are two DLC operator features:

- Operator Hold Timer
- DLC Automatic Hold

Mark the DLC operator feature assignments in the “Direct-Line Console” section of Key System Form 6a.

Hold Timer

Operator Hold Timer tracks the number of seconds callers are on hold for an operator. When a caller is on hold longer than the number of seconds programmed for the timer, the operator is reminded of the call by a single ring. You can set the Operator Hold Timer for 10-255 seconds; the factory setting is 60 seconds.

Planning Form Instructions

Under the "Operator Hold Timer" heading on **Form 6a**, do one of the following:

- Check "60 seconds" to keep the factory setting.
- Check the second box to change the factory setting. Write the number of seconds (up to 255 seconds) in the space provided.

DLC Automatic Hold

With DLC Automatic Hold, calls are placed on hold automatically when the operator presses another line button or a DSS button. The feature is disabled when the system is set up.

DLC Automatic Hold speeds the call handling for operators who frequently transfer calls using DSS buttons.

Planning Form Instructions

Under the "DLC Automatic Hold" heading on **Form 6a**, do one of the following:

- Check "Disable" to keep the factory setting.
- Check "Enable" to enable the feature.

Direct Station Selector

Page Buttons

Use these instructions only if the system has Direct Station Selectors (DSSs) connected to digital/ISDN (MLX) operator consoles.

Operators use the buttons on a DSS for one-touch automatic dialing (Auto Dial) of station extension numbers. Each Auto Dial button may be assigned up to three different extension numbers, and the Page buttons determine which extension is dialed when an Auto Dial button is pressed.

If the operator presses the first Page button, the console is set to dial the first group of extensions assigned to the Auto Dial buttons. If the second Page button is pressed, the operator reaches the second group of extensions assigned to the buttons, and the third Page button dials the third group of extension numbers.

See "System Renumbering" in Chapter 2 to review the numbering plans.

Set the three Page buttons to reach ranges of numbers that include the extension numbers in the station numbering plan and reflect the number of Auto Dial buttons available.

- If one DSS is connected to an operator console, set each Page button for a range of 50 numbers (matching the 50 available Auto Dial buttons).
- If two DSSs are connected, set each Page button for a range of 100 numbers. The Page buttons then control 100 Auto Dial buttons; 50 on each DSS.

Note: If two DSSs are used, the Page buttons on the second selector are not active.

For example, if your numbering plan contains extensions in the 100-149 and 200-294 ranges, and only one DSS is connected, set the first Page button to begin with extension 100 (the range includes extensions 100-149), the second Page button to begin with extension 200 (the range includes extensions 200-249) and the third Page button to begin with extension 250 (the range includes extensions 250-294). For a console with two DSSs connected, set the first Page button on the console to begin with 100 (the range includes extensions 100-199) and the second Page button to begin with extension 200 (the range includes extensions 200-294).

Note: Assign the lowest extension numbers in the plan to the first Page button, the middle range of numbers to the second Page button, and the highest extension numbers to the third Page button.

In addition to providing one-touch dialing of telephones, you can set the Page buttons to include one-touch feature use. For example, one Page button's range might be set to include the extension numbers reserved for Call Park codes or Group Calling extensions. (See the "Call Park Codes" instructions that follow.)

Use the information from **Key System Form 2a, System Numbering — Station Jacks**, to assign the range of stations for each Page button.

Planning Form Instructions

Mark the "Direct Station Selector" section of **Form 6a**:

In the space under the "Page Buttons" heading, write the beginning extension for the range of the 50 or 100 extension numbers for each Page button.

Call Park Codes

Park allows users to put calls into a special type of hold so that the calls can be picked up from any telephone in the system. Through Call Park codes you can provide operators who have Direct Station Selectors with one-touch use of Call Park.

See "System Renumbering" in Chapter 2.

The system automatically reserves eight extensions (881-888) for operator parking. Consider changing these factory-set extensions to numbers that fall within the Page button ranges. The same considerations apply as those used during reassignment of station extension numbers.

If you are not renumbering the factory-set Call Park codes, continue to the "Group Assigned Features" instructions.

Planning Form Instructions

Under the "Call Park Codes" heading on **Form 6a**:

1. Write the new codes assigned.
2. Locate the **Key System Form 2d, System Numbering — Special Renumbers**, and write the new numbers in the "Renumber To" column of the "Call Park Codes" section of that form.

Group Assigned Features

The system offers four features that facilitate the call-handling responsibilities of groups of users. The features and the corresponding Key System Forms used to plan them are

- Call Pickup Groups, Form 6b
- Group Paging, Form 6c
- Group Call Coverage, Form 6d
- Group Calling, Form 6e

See Chapter 1 for information about analyzing Employee Communication Survey forms.

To determine if any of the group-assigned features is appropriate for your users, see the analysis of the Employee Communication Survey. You also will need other Key System Forms as references; the specific forms needed are indicated within the instructions for each feature.

Call Pickup Groups

A call pickup group is a group of users who can answer each other's calls by pressing a programmed button on a multiline telephone or by dialing a code on a single-line telephone.

A group member does not need to know the extension number of the telephone through which the call came into pick up the call. The system automatically connects the ringing call when the button is pressed or the code is dialed. Both inside and outside calls can be picked up within a group.

Assign this feature to employees who work in a common area and who do not have a support person for coverage. You can assign up to 30 call pickup groups with up to 15 telephones per group. Each telephone can be assigned to only one group.

Compare with the "Coverage" instructions later in this chapter.

Unlike other coverage arrangements, ringing calls do not transfer from one telephone to the other automatically. Since users must choose to pick up a call, call pickup group members should be within hearing distance of each other's telephones.

Planning Form Instructions

Review the analysis of question 10 on the **Employee Communication Survey**, determine the number of call pickup groups needed, and mark **Key System Form 6b, Call Pickup Groups**.

Note: Form 6b holds the programming information for the eight call pickup groups. Duplicate the form if more groups are planned.

1. Write the group number in the "Group Number" space. Start with 1 and number the groups sequentially.

Planning Form Instructions — Continued

2. Write the name of a group, such as Customer Service, in the "Group ID" space. (Refer to the Survey Analysis).
3. Write the extension number for each group member in the "Ext. No." column. (Refer to **Form 2a**).
4. Write each group members name or location in the "Person or Location" column. (Refer to **Form 2a**).

Group Paging

Group Paging allows users to make voice announcements that are heard by a particular group of employees or by everyone. The announcement is heard through the telephone speakers rather than on an external loudspeaker paging system.

You can assign six paging groups of selected employees, such as secretarial pools, committee members, or departments, who need to hear announcements. Each group can have as many as 10 extension numbers.

The seventh paging group is factory set to page all extension numbers. This group is useful if the system does not have an external loudspeaker paging system.

See Chapter 2 "System Renumbering" for more on reassigning extension numbers.

The system automatically reserves extension numbers 793 through 799 for paging groups, Extension 799 is the page-all group. Decide whether to keep or to reassign the factory-set extension numbers. Keep in mind that you can provide one-touch use of Group Paging to operators with Direct Station Selectors if you renumber to extensions within the Page button ranges.

Planning Form Instructions

Determine the number of paging groups needed and mark **Key System Form 6c, Group Paging**.

1. Write the name of the group, such as Sales, in the "Group ID" space.
2. To change the factory set extension number:
 - Write the new number in the "Renumber To" space.
 - Locate **Key System Form 2d, System Numbering — Special Renumbers**, and write the new number in the "Renumber To" column of the "Group Paging" section of that form.
3. Write the extension number for each group member in the "Ext. No." column. (Refer to **Form 2a**).
4. Write each group member's name or location in the "Person or Location" column. (Refer to **Form 2a**).

Coverage

See "Coverage" in Chapter 2 of System Reference for more information.

Coverage allows calls to users (called senders) to be covered by one or more telephones (called receivers). Coverage can be individual or group assigned. These instructions are for both Individual and Group Coverage.

Individual Coverage

Individual Coverage allows a one-on-one arrangement in which calls from one sender are covered by one or more receivers.

A sender can have calls covered by up to eight receivers, and a receiver (such as a secretary) can provide Individual Coverage for more than one sender. Any type of telephone can be a sender; only a multiline telephone with programmable buttons available can be a receiver.

Individual Coverage is set up by programming a Cover button on a receiver's telephone. The receiver must have a programmed Cover button for each sender whose calls are being covered.

When a sender's telephone rings, the call is immediately sent to the receivers' telephones and the lights next to the Cover buttons flash. The telephones ring depending on the type of coverage and the ringing option set for each receiver telephone.

A receiver can provide

■ **Primary Individual Coverage** with the following ringing options:

- Immediate Ring. The receiver's telephone rings at the same time the sender's telephone rings.
- Delayed Ring. The receiver's telephone rings after the Delayed Ring Interval programmed for the system.
- No Ring. The receiver's telephone does not ring.

■ **Secondary Individual Coverage** with the following ringing options:

- Immediate Ring. The receiver's telephone rings after the sender's telephone rings twice. This two-ring Secondary Delay Interval is fixed and cannot be changed.
- Delayed Ring. The receiver's telephone rings after the sender's telephone rings twice plus the Delayed Ring Interval programmed for the system. For example, if the Delayed Ring Interval is set to 2 rings, the receiver's telephone rings after the sender's telephone rings four times.
- No Ring. The receiver's telephone does not ring.

Both primary and secondary Individual Cover buttons can be programmed for each individual sender as long as the maximum does not exceed eight receivers.

Assign primary Individual Coverage when coverage is needed between two users—for example, an executive who wants calls answered by a secretary, or a DLC operator who routinely covers calls for another operator.

See "Group Coverage" in this section for more on the Delayed Ring Interval.

See "Group Coverage" in this section for more on the Delay Ring Interval

Assign secondary Individual Coverage for senders whose calls need less frequent coverage—for example, users who provide backup only during peak calling periods.

See "Personal Lines" in Chapter 2 of System Reference.

Calls received on personal lines programmed for immediate or delayed ring are eligible for coverage. Calls on personal lines programmed for no ring are not covered.

If a principal user is assigned, all calls are sent to the principal's receivers. If the principal user has Remote Call Forward, calls are sent to an outside number rather than the coverage receivers.

Planning Form Instructions

Review the **Employee Communication Survey** analysis and determine which users (senders) need individual coverage.

To set up Individual Coverage, program Cover buttons on the receivers' telephones. Locate the specific receiver telephone forms from copies of

- Key System Form 4a, Analog Multiline Telephone
- Key System Form 4b, Digital/ISDN (MLX) Telephone
- Key System Form 4c, Tip/Ring Equipment
- Key System Form 5a, Direct-Line Console (DLC) — Analog
- Key System Form 5b, Direct-Line Console (DLC) — Digital/ISDN

Use **Key System Form 2a, System Numbering — Station Jacks** for sender information. Use **Forms 4a, 4b, 4c, 5a, or 5b** to record this information.

1. On the forms for sender telephone(s), under the "Individual Coverage Receivers" heading, write the extension number for each primary and secondary receiver in the spaces provided.
2. On the forms for the receiver telephone(s), locate an available button on the "Button Diagram" and write "Ind Cover" and the senders extension number. Write "P" to indicate primary or "S" to indicate secondary Individual Coverage.

Note: Single-Line telephones cannot be receivers.

Group Coverage

In Group Coverage, senders are organized into groups and calls received by any member of the group are sent to a receiver.

Any type of telephone can be a member of a coverage group; however, no individual sender can be a member of more than one group. A maximum of 30 coverage groups can be set up, and there is no limit to the number of senders in each group.

Group Cover buttons are programmed on the receiver telephone for each coverage group whose calls are covered. Only Group Coverage receivers with display telephones can identify the individual sender. Non-display users can determine only that a call is from the coverage group.

Two types of receivers can be programmed:

- **Multiline telephones.** A maximum of eight Group Cover buttons can be programmed for each coverage group. All eight can be programmed on one multiline telephone or the Group Cover buttons can be distributed over up to eight multiline telephones.

A single receiver can have more than one Group Cover button for the same coverage group; however, each programmed button is counted in the eight Group Cover button maximum for the group.

Single-line telephones cannot be programmed individually as Group Coverage receivers; however, if a single-line telephone is programmed as a member of a calling group, it can receive Group Coverage calls.

A receiver can program each Group Cover button for immediate ring, delayed ring, or no ring.

- **Calling groups.** If a calling group is programmed as a receiver for a coverage group, it can be the only Group Coverage receiver for the group. No other types of group receivers can be programmed; however, both primary and secondary Individual Coverage receivers can be assigned.

When a calling group is assigned a receiver, the calls enter the calling group queue and are delivered to the first available member. Since calls are sent to the queue, Cover buttons are not needed.

When a calling group is programmed as a receiver, or both Individual and Group Coverage are programmed for a sender, Group Coverage has a system-wide Cover Delay Interval. The delay interval is the number of rings before a call is sent to the receiver.

Assign Group Coverage when more than one sender requires the same coverage arrangements—for example, for all members of a department whose calls are answered by a secretary. Also consider assigning more than one Group Cover button on one receiver's telephone (for example, on a DLC) if a coverage group is expected to get large numbers of calls.

You can assign up to 30 coverage groups, each with an unlimited number of members. Coverage senders can be a member of only one group.

Note: Group Coverage can be used alone or can be setup to work with either primary or secondary Individual Coverage, or both. This allows callers to get personal attention from the primary and/or secondary Individual Coverage receiver and backup from Group Coverage. For example, a receiver such as a secretary can have a Primary Cover button to provide Individual Coverage for a sender who is also a member of a coverage group.

Decide the interval for Coverage Delay and for Delayed Ring (the number of rings before a receiver telephone with the Delayed Ring option begins to ring).

You can change the factory-set, three-ring Coverage Delay Interval to an interval of from one to nine rings. The factory-set Delayed Ring Interval of two rings can be changed to an interval of from one to six rings.

Note: The ringing pattern heard by an outside caller is shorter than the audible ringing heard at an MLX or analog multiline telephone even though the total time is exactly the same. An outside caller hears from one to two rings in addition to the number of rings programmed for the Delayed Ring Interval and Coverage Delay Interval. For example, if the Delayed Ring Interval is programmed for two rings and the Coverage Delay Interval is programmed for one ring, an outside caller hears four rings before the call is sent to coverage. If both intervals are set to their maximum values, the caller will hear two additional rings.

Planning Form Instructions

Review the **Employee Communication Survey** analysis and determine the senders to be grouped. Record both sender groups and receivers on **Key Systems Form 6d, Group Coverage**.

Note: **Form 6d** holds information for eight coverage groups. Duplicate the form if more groups are planned.

Locate **Key System Form 2a, System Numbering — Station Jacks** for sender information and the specific receiver forms from copies of **Key System Forms 4a** through **5b**.

Under the "Coverage Delay Interval" heading, at the top of **Form 6d**:

1. Check "3 rings" to keep the factory set interval.
2. Check the second box to change the factory-set interval. Write the number of rings in the space provided.

Under the "Delayed Ring Interval" heading:

3. Check "2 rings" to keep the factory set interval.
4. Check the second box to change the factory-set interval. Write the number of rings in the space provided.

In each column:

5. Write the group number in the "Group No." space. Start with 1 and number the groups sequentially.
6. List the extension numbers of all senders in the group in the upper block. (Refer to **Form 2a**).
7. List the extension numbers for all receivers in the group in the lower block. (Refer to **Form 2a**).
8. If designating a calling group as a receiver, write "Calling Group" next to the extension number. (Refer to **Form 6e**).

Note: If you have not yet created calling groups, you must defer naming them as receivers until later.

On each copy of **Forms 4a, 4b, 5a, and 5b** that describes a specific receiver:

9. Locate an available button in the "Button Diagram" area.
10. Write "Group Cover" and the coverage group number on it.

Group Calling

Group Calling allows you to group the telephones of people (such as ticketing agents) who all handle the same type of call. Through the Group Calling feature all telephones in the group are assigned to a single extension number that is used by both inside and outside callers to reach the group. The individual extension numbers of the telephones are still used by callers who need to reach a specific member of the calling group.

See "Extension Status" Instructions later in this chapter.

Note: The Extension Status must be set for the Group Calling/CMS configuration in order for calling groups to be available.

Calls to the single extension number are distributed among the group members in a circular pattern. The system hunts for the first available telephone, starting with the one that received the last call. If no group member telephone is available, calls are held in a queue and the caller can be given a recorded announcement explaining the delay.

Group members make themselves available to take calls by logging in and unavailable to take calls by logging out using a programmed button or dialing a code. Calls for the group are received at the telephone only when the group member is logged in and is not busy on the telephone.

Calls to group members ring on Intercom Voice or Intercom Ring buttons. If the call is not answered within 30 seconds, the call is sent to another member or back to the queue. The system automatically logs out the unanswered telephone and makes it unavailable for subsequent calls until the group member logs in.

Assign Group Calling for people who handle the same type of incoming calls. Sales representatives, service representatives, and ticketing agents are good candidates.

- Assign up to 32 calling groups with up to 20 members per group. Each telephone user can be a member of only one calling group.
- Designate particular lines to ring directly into a calling group. Incoming calls on a given line can be directed to only one calling group.
- If you are using the MERLIN Attendant or another voice messaging system, reserve one or more calling groups for that feature.

See "System Renumbering" in Chapter 2 for more on reassigning extension numbers.

The system automatically reserves extension numbers 770–791 and 7920–7929 for calling groups. (These may be changed.) If operators with DSSs need one-touch use of Group Calling, renumber to extensions that fall within the Page button ranges.

Planning Form Instructions

Review the **Employee Communication Survey** analysis and determine the number of calling groups needed. Make that number of copies of both sides of **Key System Form 6e, Group Calling**.

Note: Form 6e has two sides. List the extensions (and lines) assigned to the group on the front and specify the options for the group on the back.

On the front of **Form 6e**:

1. Write the group number in the "Group No." space. Start with 1 and number sequentially.
2. Write the name of the group in the "Group ID" space. (Refer to the survey analysis).
3. Write the factory set extension number in the space provided (770 for group 1, 771 for group 2, etc).
4. To change the factory set extension number:
 - Write the new number in the "Renumber To" space.
 - Locate the **Key System Form 2d, System Numbering — Special Renumbers**, and write the Group ID and the new number in the "Renumber To" column of the "Group Calling" section of that form.
5. In the "Stations" area of **Form 6e**, write the extension number of each member of the group in the "Ext. No." column, and the name of the person or location in the "Person or Location" column. (Refer to **Form 2a**).

Note: Before you complete the extension number and name entries, read the "Hunt Type" instructions that follow.
6. In the "Lines" area of **Form 6e**, for each line that is to ring directly into the calling group, write the line number next to the logical ID. (Refer to **Form 2c**).

The following options are available for a calling group:

- Hunt Type
- Delay Announcement
- Message-Waiting Receiver
- Calls-in-Queue Alarm Threshold
- External Alert for Calls-in-Queue Alarm
- Overflow Coverage
- Overflow Threshold
- Group Type

Use the **"Calling Group Options"** section on the back of each copy of **Form 6e** to record each option. Copy the Group No. and ID from the front of the form.

Hunt Type

Hunt Type allows you to change the hunting pattern from the factory-set circular type to linear. The system then searches for an available telephone in the order that telephones are assigned to the calling group.

If you choose linear hunt, be sure you have listed the extension numbers and names in the "Stations" area on the front of Form 6e in the order that you want the group searched. If you have not done this, go back and correct the front of the form so that the extensions are in the right order.

Planning Form Instructions

Under the "Hunt Type" heading on **Form 6e**:

1. Check "Circular" to keep the factory-set hunting pattern.
2. Check "Linear" to change the factory-set hunting pattern.

Delay Announcement

Delay Announcement allows you to designate an announcement device to play messages to callers. The announcement plays once for each call that is placed in the queue.

The device designated for Calling Group delay announcement can be any device connected directly to the control unit on a 008 OPT or 012 basic telephone module. Also, the device can be connected to digital/ISDN (MLX) telephones using a Multi-Function Module (MFM) in the tip/ring mode.

See "Call Restrictions" earlier in this chapter for information on toll restriction.

Only one announcement device can be designated for each calling group; however, more than one calling group can use the same announcement device. The device should not be assigned as a group member, and it must be outward restricted, to prevent anyone attaching a telephone and dialing unauthorized calls.

Planning Form Instructions

Under the "Delay Announcement" heading on **Form 6e**:

1. Do *one* of the following:
 - Check "No" if you do not want an announcement device and continue to the "Message Waiting Receiver" instructions.
 - Check the second box to designate an announcement device. Write the device's extension number in the space provided. (Refer to **Form 2a** or **2 b**).

Locate the copies of **Forms 4b, 4c, and 5b** that describe the device(s) you are designating for delay announcement use.

In the "Type" or "Adjuncts" sections under "Answering Machine":

2. Check the box that indicates that the answering machine is used as a delay announcement device.
3. Write the calling group extension number(s) for the group(s) using the device.
4. Verify that the "Outward Restrict" is selected under "Call Restriction".

Message Waiting Receiver

Message Waiting Receiver allows you to designate a telephone to receive message-waiting indications for the group. The message receiver for a calling group does not have to be a member of the group.

Each calling group can have only one telephone assigned as its message receiver. The same telephone can be assigned as the message receiver for more than one calling group.

Planning Form Instructions

Under the "Message Waiting Receiver" heading on **Form 6e**, do one of the following:

- Check "No" if you are not assigning a receiver.
- Check the second box if assigning a receiver. Write the extension number of the Message Waiting Receiver. (Refer to **Form 2a**).

Calls-in-Queue Alarm Threshold

See "External Alert for Calls-in-Queue Alarm" that follows.

Calls-in-Queue Alarm Threshold allows you to set the limit for the number of unanswered calls that wait in the calling group queue before group members are notified. Once the threshold is reached, group members are notified with a light on the telephone and an external alert if one is assigned.

The factory-set threshold is 1 call. You can change the number of calls to up to 99 calls.

Planning Form Instructions

Under the "Calls-in-Queue Alarm Threshold" heading on **Form 6e**, do *one* of the following:

- Check "1 Call" to keep the factory setting.
- Check the second box to change the factory set number of calls allowed in the queue before members are notified. Write the number of calls in the space provided.

External Alert for Calls-in-Queue Alarm

External Alert for Calls-in-Queue Alarm allows group members to be notified by an external alert when calls waiting in the queue are equal to or greater than the programmed threshold. The alerting signal remains active until the number of calls in the queue drops below the threshold.

Note: Since the signal is continuous, it is recommended that only lamp-type external alerting devices be used.

The external alert designated for Calls-in-Queue Alarm can be any alerting device connected through a Multi-Function Module (MFM) in the External Alert mode for digital/ISDN (MLX) telephones. Only one external alert can be designated for each calling group.

Note: An alert connected to a Supplemental Alert Adapter (SAA) for an analog multiline telephone should not be used as a Calls-in-Queue Alarm.

Planning Form Instructions

Under the "External Alert for Calls-in-Queue Alarm" on **Form 6e**:

1. Do *one* of the following:
 - Check "No" if you do not want an external alert for Calls-in-Queue Alarm and continue to the "Overflow Coverage" instructions.
 - Check the second box to designate an external alert. Write the extension number for the alert in the space provided. (Refer to **Form 2b**).

Locate the copies of **Forms 4b** and **5b** that describe the alerting device you are designating for Calls-in-Queue Alarm use.

In the "Adjuncts" section, under "Alert Device":

2. Check the box that indicates the alert is used as a Calls-in-Queue Alarm.
3. Write the calling group extension number in the space provided.

Overflow Coverage and Overflow Threshold

You can provide backup coverage for a calling group by designating another calling group to receive calls when the number of calls waiting in the queue reaches a certain level.

A calling group can provide overflow coverage for more than one calling group; however, group members cannot tell which group's calls they are answering. In addition, callers do not hear the overflow group's delay announcement.

If you assign an overflow group, choose the threshold (the number of calls to wait in queue before they are sent to the overflow group). The factory setting is 1. You can change the setting to up to 99 calls.

Planning Form Instructions

Locate the copy of **Key System Form 6e, Group Calling** that lists the extension number for the group to be designated as the overflow calling group.

Under the "Overflow Coverage" heading on **Form 6e**:

1. Do *one* of the following:
 - Check "No" if you do not want overflow coverage and continue to the "Group Type" instructions.
 - Check the second box to designate overflow coverage by another calling group. Write the calling group number of the overflow calling group in the space provided.

Under the heading "Overflow Threshold":

Do *one* of the following:

- Check "1 Call" to retain factory setting.
- Check the second box to change the threshold. Write the number of calls (up to 99) in the space provided.

Group Type

Group Type determines whether or not the system automatically logs in members of a calling group following a power failure. The factory setting is no automatic system login (auto logout).

You can change the factory setting to one of the following:

- **Auto Login.** Use this setting when a Call Management System (CMS) is connected to the system to specify that the system automatically logs in calling group members following a power failure and does not log out users who do not answer a call. This setting also is used for calling groups used for data (called data hunt groups). See the *Data Guide* for more detailed information.
- **Integrated VMI** Use this setting when a voice messaging system such as AUDIX Voice Power—IS II or MERLIN MAIL Voice Messaging System, which require special signaling for integrated operation, is connected to one or more station jacks assigned to a calling group. The system automatically logs in the group members following a power failure.
- **Generic VMI.** Use this setting when a voice messaging system such as MERLIN Attendant or Integrated Voice Power Automated Attendant—IS II, which does not require special signaling, is connected to one or more station jacks assigned to a calling group. The system automatically logs in the group members following a power failure.

Planning Form Instructions

Under the "Group Type" heading on **Form 6e**:

1. Check "Auto Logout" to keep the factory setting of no automatic login.
2. To change the factory setting from Auto Logout:
 - Check "Auto Login" to show automatic login for a CMS or a data station.
 - Check "Integrated VMI" to show automatic login for a voice messaging system that requires special signaling for integrated operation.
 - Check "Generic VMI" to show automatic login for a voice messaging system that does not require special signaling.

System Features

See *System Reference* for more information on system features.

System features affect all users and all or most of the telephones. **Record your decisions about them on Key System Form 6f, System Features.**

Transfer of Calls Options

The Transfer feature allows users to transfer outside or inside calls to another telephone through the following options:

- Transfer Return Interval
- One-Touch Transfer
- Transfer Audible
- Type of Transfer

Transfer Return Interval

The Transfer Return Interval is the number of rings before a call transferred to another telephone is returned to the person transferring the call.

The factory-set number of rings is four. You can change the setting to one to nine rings or change the setting to zero if you do not want the calls to return to the original telephone.

Planning Form Instructions

Under the "Return Time Interval" heading in the "Transfer Options" section of **Form 6f**, do *one* of the following:

- Check "4 Rings" to keep the factory setting.
- Check "0 Rings" to indicate no return for transferred calls.
- Check the third box to change the factory set number of rings. Write the number of rings in the space provided.

One-Touch Transfer

When the system is set up, it is set for One-Touch Transfer, which allows users to transfer calls to another person by pressing a preprogrammed Auto Dial button or DSS button for that person. You can change this option to One-Touch Hold so that people must use the Transfer button to initiate transfers.

If you decide to keep One-Touch Transfer, decide whether transfer completion is manual or automatic:

- Automatic completion (the factory setting) means that transfer is initiated and completed by pressing the Auto Dial or DSS button.
- Manual completion means that the person transferring the call can consult with the other person, and then complete the transfer by pressing another button (after pressing the Auto Dial button or DSS button).

Planning Form Instructions

Under the "One-Touch Call Handling" heading in the "Transfer Options" section of **Form 6f**, do *one* of the following:

- Check "One-Touch Transfer" to keep the factory setting.
 - To keep the factory set automatic completion of transfers, check that box.
 - To change the factory setting to manual completion, check that box.
- Check the "One-Touch Hold" if you do not want to keep the One-Touch Transfer feature.

Transfer Audible

The Transfer Audible option allows you to select whether an outside caller hears Music-on-Hold or ringing (called ringback) while being transferred.

Note: If you use equipment that rebroadcasts music or other copyrighted materials, you may be required to obtain a copyright license from, and pay license fees to, a third party such as the American Society of Composers, Artists, and Producers (ASCAP) or Broadcast Music incorporated (BMI). Or, you can purchase a Magic on Hold system, which does not require you to obtain such a license, from AT&T or an authorized representative.

Planning Form Instructions

Under the "Transfer Audible" heading in the "Transfer Options" section of **Form 6f**, do *one* of the following:

- Check "Music-on-Hold" if you plan to play music while callers are being transferred.
- Check "Ringback" if you are not providing music.

Type of Transfer

Type of Transfer determines whether the system automatically selects a Ring or Voice button when the person transferring a call presses either the Transfer button or an Auto Dial button for One-Touch Transfer. The factory setting is the Ring button. You can change the factory setting to the Voice button, which means that calls can be transferred with a voice announcement.

Planning Form Instructions

Under the "Type of Transfer" heading in the "Transfer Options" section of **Form 6f**, do *one* of the following:

- Check the "Ring button" for the system to select a ring button for transferred calls.
- Check the "Voice button" for the system to select a voice button for transferred calls.

Camp-On Return Time

Camp-On Return Time is the number of seconds a caller waits when a person uses the Camp-On feature to complete the transfer of a call to a busy telephone. If the telephone is still busy at the end of the programmed interval, the call returns to the person who transferred the call.

You can change the factory-set 90-second interval to 30-300 seconds.

Planning Form Instructions

Under "Camp-On Return Time" on **Form 6f**, do *one* of the following:

- Check "90 seconds" to keep the factory-set interval.
- Check the second box to change the factory-set interval. Write the number of seconds in the space provided.

Call Park Return Time

Call Park Return Time is the number of seconds a caller waits when the Call Park feature is used to put a call on hold. If the call is not picked up at the end of the programmed interval, it returns to the person who parked the call.

You can change the factory-set 180-second interval to 30-300 seconds.

Planning Form Instructions

Under "Call Park Return Time" on **Form 6f**, do *one* of the following:

- Check "180 seconds" to keep the factory-set interval.
- Check the second box to change the factory-set interval. Write the number of seconds in the space provided.

Automatic Callback

Automatic Callback enables the system to automatically complete calls to busy lines or extensions as soon as the extension or line becomes available.

The system alerts the user that the call is ready for completion by ringing the telephone. If the user does not answer within a certain number of rings, the system cancels the request. The number of rings before the system cancels the request is called the "Automatic Callback Interval."

You can change the factory-set interval of three rings to one to six rings.

Planning Form Instructions

Under "Automatic Callback Interval" on **Form 6f**, do *one* of the following:

- Check "3 rings" to keep the factory-set interval.
- Check the second box to change the factory-set interval. Write the number of rings in the space provided.

Extension Status

Extension Status allows an operator, a calling group supervisor, or a Call Management System (CMS) supervisor to determine the status of a telephone at a glance. The lights next to the buttons on a DSS or next to Auto Dial buttons programmed with extension numbers indicate the status of the telephone.

There are two configurations for Extension Status:

- In the **hotel configuration**, employees at the front desk of hotels and motels use the feature to monitor room availability and to restrict the telephones when the rooms are not occupied. There are three extension states:
 - **Status 0—green light is off.** Room is occupied and telephone is in regular call-handling state.
 - **Status 1—green light is flashing.** Room is vacant and ready for cleaning, and outside calls cannot be made from the telephone.
 - **Status 2—green light is on.** Room is vacant and outside calls cannot be made from the telephone.
- In the **Group Calling/CMS configuration**, calling group or CMS supervisors use this feature to monitor the availability of agents to take calls directed to the calling group. There are two extension states:
 - **Status 0—green light is off.** Telephone is signed out from the group and the agent is unavailable to take calls.
 - **Status 2—green light is on.** Telephone is signed into the group and calls can be sent to the agent.

Hotels or Motels may assign different meanings to the three extension states.

Decide on the configuration and assign operator positions to monitor extension status. If no positions are assigned, the feature is not active.

Planning Form Instructions

Under the "Extension Status" heading on **Form 6f**:

1. Check "Assign to Operator Positions". Write the extension number for each operator position in the space provided. (Refer to the appropriate copy of **Form 5a** or **5b**).
2. Check "Group Calling/CMS" to keep the factory set configuration.
3. Check "Hotel" to change the configuration.

On all copies of **Form 5a** or **5b**, under the heading "Extension Status":

4. Check "No" or "Yes" to indicate whether the feature is active.

Station Message Detail Recording

Use these instructions only if connecting Station Message Detail Recording (SMDR).

SMDR allows you to keep track of telephone usage. Through this feature detailed call reports are generated that include information about incoming and outgoing calls, such as date and time, the length of the call, the line used, the user's extension number, the dialed number, and the account code.

The information in call reports is helpful for billing customers and internal departments for telephone calls. It helps to identify telephone misuse and develop records of telephone traffic patterns to improve system efficiency. SMDR works in conjunction with the Call Accounting System (CAS/B, CAS/H, CAT/B, or CAT/H) or a serial printer (AT&T 572 printer or equivalent) connected to the SMDR port on the control unit. The SMDR port is the upper RS-232 jack on the processor module.

Following are your choices of options if you use SMDR:

- **Call Report Format.** Choose either the factory-set basic format or the ISDN format. Select the ISDN format if you subscribe to the AT&T INFO2 automatic number identification (ANI) service. With the ISDN format, the ANI appears in the Number field of the call report.

Note: The availability of the caller identification information may be limited by local-serving (caller's) jurisdiction, availability, or central office equipment.

- **Call Length.** The system is factory set to record only calls that last at least 40 seconds. You can choose a new setting of from 0 to 255 seconds as the maximum length before it is recorded.

- **Calls Reported.** Choose whether information is to be recorded for the factory setting of incoming and outgoing calls or for outgoing calls only.

Note: To have accurate reports, the system date and time must be set to the current date and time when the system is installed. Be sure you checked "Yes" for each of these options on Form 1.

Planning Form Instructions

In the "SMDR Options" section of **Form 6f**:

Under the "Call report Format" heading, do *one* of the following:

- Check "Basic" to keep the factory set format.
- Check "ISDN" to change the report format.

Under the "Call Length" heading, do one of the following:

- Check "40 seconds" to keep the factory set call length.
- Check the second box to change the factory set call length. Write the number of seconds in the space provided.

Under the "Calls Reported" heading, do one of the following:

- Check "Incoming and Outgoing" to keep the factory setting.
- Check "Outgoing Only" to change the factory setting.

Inside Dial Tone

Two types of inside dial tone are offered, which make it easy to distinguish an inside line from an outside line—system internal dial tone (the factory setting) and outside line dial tone.

Some software applications, such as voice messaging systems, or hardware, such as modems, do not recognize the internal dial tone. In this case, change the system so that inside dial tone is the same as the outside dial tone to allow recognition by a third-party system.

Consult with AT&T or an authorized representative to help guide your decision.

Planning Form Instructions

Under the "Inside Dial Tone" heading on **Form 6f**, do *one* of the following:

- Check "Inside" to keep the factory set system internal dial tone.
- Check "Outside" to change the dial tone to match the outside line dial tone.

Reminder Service Cancel

Through Reminder Service operators can have the system place reminder calls to people at preset times. For example, a hotel operator can set the time for a wake-up call to a room telephone. Reminder times can be set and canceled for any telephone in the system.

Reminder Service also allows regular telephone users to use the telephone like an alarm clock to remind them of an appointment or meeting. Users can set and cancel their own reminder times on their telephones.

You can set a time so that all reminders are canceled at that time every day—for example, at the end of the business day when all users have gone home and are not available to receive reminders.

Planning Form Instructions

Under the "Reminder Service Cancel" heading on **Form 6f**, do *one* of the following:

- Check "No" if you do not want to set a Reminder Service cancel time.
- Check the second box to set a time to cancel all reminders in the system. Write the time of day in the space provided.

Redirect Calls to Unassigned Extension Numbers

The factory setting for calls made to unassigned extension numbers by Remote Access users on dial-in tie trunks is that the calls are redirected to the primary operator.

You can change the setting so that calls are redirected to another extension number or a calling group

Planning Form Instructions

Under the "Calls to Unassigned Extensions" heading on **Form 6f**, do *one* of the following:

- Check "Primary Operator" to keep the factory setting.
- To change from the factory-set redirect to the primary operator:
 - Check "Another Extension" to redirect calls to another telephone. Write the extension number in the space provided. (Refer to **Form 2a**).
 - Check "Calling Group" to redirect calls to a calling group. Write the calling group extension number in the space provided. (Refer to **Form 6e**).

Allowed Lists

Use these instructions only if call restrictions are assigned to any telephones.

An Allowed List is a list of telephone numbers that a restricted telephone can dial. For example, if a telephone is restricted from making toll calls, an Allowed List permits the user to call specific area codes and/or exchanges. Or, if a telephone is restricted from making any outgoing calls, you can design an Allowed List that permits calls to specific local or toll numbers, such as 911.

You can design up to eight lists, each with a maximum of 10 numbers. Each number can have up to six digits—for example, an area code followed by an exchange. You can include a leading 1, which the system doesn't count as one of the six digits, if a toll prefix is required. Once you have designed the lists, decide which restricted telephones have access to the list. Each restricted telephone can have access to one to eight lists.

If FX (foreign exchange) lines or tie trunks are connected to the system, you can allow people with restricted telephones to dial numbers to the area code for the FX line or tie trunk if you enter the exchange in the Allowed List. For example, if you have an Albuquerque FX line (to the 345 exchange in the 505 area code), record "345" as the Allowed List entry, not "505345".

As you design each list, consider which numbers need to be called by specific groups of restricted users. Suppose you had customer service representatives with toll restricted telephones in Colorado who need to speak with customers in New Mexico (area code 505) and Arizona (area code 602). You would design a list with area codes 505 and 602 and assign the customer service representatives access to that list.

Another list of emergency numbers could be designed for telephones that are restricted from local and toll calls. This ensures that telephones restricted from making outside calls can be used in an emergency.

Note: If you assign a zero as the first digit for any entry in an Allowed List, any toll restrictions assigned for calls to numbers that can be placed by local or toll operators are removed.

Planning Form Instructions

On **Key System Form 6g, Allowed Lists:**

1. Write the name of the list in the space next to the list number.
2. Write the allowed area codes and/or exchanges in the column (a maximum of 10 entries per list).
3. Write the extension numbers of the telephones that need access to the list in the "Allow to Ext. Nos." column. (Refer to **Form 2a**).

If you planned Remote Access with restrictions, and want to permit Allowed List numbers to remote access users, locate **Key Systems Form 3a, Outside Lines — Remote Access**.

On page 3, "Class of Restriction without Barrier Codes":

4. Write the list numbers under the heading "Allowed List Access" (for either or both tie trunks and non-tie lines).

On all copies of page 4, "Class of Restriction with Barrier Codes":

5. Write the list numbers under the heading "Allowed List Access" (for each barrier code assigned).

Note: Allowed List Class of Restriction assignments apply to all Remote Access users, and cannot be assigned on an individual basis.

See "Remote Access" in Chapter 3.

Disallowed Lists

Use Disallowed Lists to prevent people from making calls to specific numbers—numbers that even unrestricted telephones cannot dial. You can use this feature instead of restricting telephones totally from making toll or local calls.

For example, to prevent people from calling time and temperature, their horoscopes, or other services typically offered on the 976 exchange, disallow calls to that exchange. Or, to prevent employees from calling "talk" lines typically offered in the 900 area code, disallow calls to that area code.

You can use a "wild card" character to indicate that you want calls to an exchange restricted in every area code—for example, the 976 exchange in any state. During system programming, a "pause" (entered using the Hold button) indicates a wild card character; therefore, use the letter "p" to indicate that a wild card character should be programmed.

You can design up to eight lists with a maximum of 10 numbers. Each number can have up to 11 digits—for example, a leading 1 (if a toll prefix is required for dialing) followed by the area code and telephone number. Once you have

designed the lists, decide which telephones to restrict. You can assign each telephone to one to eight lists.

Note: Users cannot dial a number on an Allowed List if it matches a number on a Disallowed List assigned to the telephone.

Planning Form Instructions

On **Key System Form 6h, Disallowed Lists:**

1. Write the name of the list in the space next to the list number.
2. Write the disallowed area codes and/or exchanges in the column (a maximum of 10 entries per list).

Use the wild card character ("p") to restrict an exchange from being dialed in any area code. For example, to prevent users from directly dialing the 976 exchange in any area code, write "1ppp976".

3. Write the extension numbers of the telephones that you want to assign to the list in the "Disallow to Ext. Nos." column. (Refer to **Form 2a**).

If you planned Remote Access and want to restrict callers through Disallowed Lists, locate **Key System Form 3a, Outside Lines — Remote Access**.

On page 3, "Class of Restriction Without Barrier Codes":

4. Write the list numbers under the heading "Disallowed List Access" (for either or both tie trunks and non-tie lines).

On all copies of page 4, "Class of Restriction With Barrier Codes":

5. Write the list numbers under the heading "Disallowed List Access" (for each barrier code).

Note: Disallowed List Class of Restriction assignments apply to all Remote Access Users and cannot be assigned on an individual basis.

See "Remote Access" in Chapter 3.

Night Service

Use these instructions only if Night Service is used for after-hours telephone operation.

Night Service offers three options for after-hours telephone operation. Choose any combination of these options:

- Night Service with Group Assignment
- Night Service with Outward Restriction
- Night Service with Time Set

Mark Key System Forms 7a through 7c to show your option choices.

Night Service with Group Assignment

The Night Service with Group Assignment option allows you to assign all the calls or lines associated with a particular operator position to a Night Service group. This makes it easier for users to answer after-hours calls.

Any call that comes in to the operator console while Night Service is in effect rings immediately at each available telephone in the group. Calls ring immediately even on lines set for delayed ring or no ring.

You can create up to eight Night Service groups, one for each operator. There is no limit to the number of telephones assigned to each group, and each telephone can be assigned to more than one group.

Planning Form Instructions

Record your decisions on **Key System Form 7a, Night Service — Group Assignment**.

Note: Form 7a has two sides and accomodates information for up to eight operators.

In each column:

1. Write the extension number for the operator whose calls are being answered in the "Operator Ext. No." space. (Refer to **Form 2a**).
2. Write the extension number for each member of the group in the "Ext. No." column. (Refer to **Form 2a**).
3. Write each group member's name in the "Name" column. (Refer to **Form 2a**).

Night Service with Outward Restriction

The Night Service with Outward Restriction option allows you to setup the system so that only authorized users can place non-emergency calls when Night Service is in effect. This prevents unauthorized after-hours use of telephones.

When you select this option, people who need to make calls after hours must first enter a password. People who do not know the password can dial only emergency numbers that you specify, such as the telephone numbers for the police and fire departments. Calls to non-emergency numbers do not go through unless the password is entered first. You can include up to 10 telephone numbers on the Night Service Emergency Allowed List. Each number can have a maximum of 12 digits.

Once you specify that a password is required, the password applies to all telephones in the system when Night Service is activated at any operator position.

If users need to make after-hours calls and prefer not to enter a password, you can set up an Exclusion List that excludes those users from the password requirement. Telephones assigned to the Exclusion List keep the normal call restrictions, if any are assigned, when Night Service is in effect. However, these telephones are not protected in any other way from unauthorized after-hours use.

Planning Form Instructions

On **Key System Form 7b, Night Service — Outward Restriction:**

1. Write the password in the "Password" space. The password must be four digits and can include the numbers from 0 to 9 in any combination.

Note: To keep the password private, do not fill in the blank.

2. Write the numbers to be included in the list, under "Telephone No." in the "Emergency Allowed List" section.

To exclude people from the password requirement, complete the "Exclusion List" section.

3. Write the extension number for each person in the "Ext. No." column (Refer to **Form 2a**).
4. Write each user's name in the "Name" column. (Refer to **Form 2a**).

Night Service with Time Set

The Night Service with Time Set option allows you to set the system to automatically turn Night Service on and off at the times and days of the week you specify. This ensures that after-hours calls are handled properly even if an operator forgets to turn on Night Service.

Operators can still override the timer and turn Night Service on or off manually. The feature can also be deactivated through system programming for special conditions, such as a mid-week holiday.

Planning Form Instructions

On **Key System Form 7c, Night Service — Time Set**, write the time of day you want Night Service turned on and off for each day of the week.

Use 24-hour numbering, called military time — for example, 5:30PM = 1730.

If Night Service is to remain on throughout the day—for example, on Sunday —don't enter an on and off time.

Labeling

Labeling enhances the capability of display telephones used with the system. Choose the labels to appear on display telephones:

- Lines
- Stations and Calling Groups
- Posted Message
- System Directory/System Speed Dial

Lines

Line labels identify the line being used or the department being called. For example, when a call comes in on one of the incoming lines, a number, such as 5559876, or the name of the department to which it belongs, such as Sales, is displayed. Used with the AT&T INFO2 automatic number identification (ANI) service, the labels also identify the number of the caller.

Note: The availability of the caller identification information may be limited by local-serving (caller's) jurisdiction, availability, or central office equipment.

The labels can contain up to seven characters, including capital letters, numbers, ampersand (&), dash (-), space, colon (:), asterisk (*), and pound sign (#).

Planning Form Instructions

On **Key System Form 8a, Label Form — Lines**, in the "Label" column:

Write the label for each line next to its line number.

Stations and Calling Groups

When the system is first set up, users with display telephones see only the extension number of the person calling them for inside calls, calling group calls, transfer returns, and Leave Word Calling messages.

You can associate alphanumeric labels with extension numbers so that both the name of the caller and the extension number are displayed. For example, you might assign the label "TERRY" to extension number 20. Then users with display telephones can see that they have incoming calls from Terry at extension 20 or that Terry at extension 20 has left "call me" messages. The labels can contain up to seven letters and/or numbers.

Planning Form Instructions

Review **Key System Form 2a, System Numbering — Station Jacks** and **Form 6e, Group Calling**, and determine the labels needed.

On **Key System Form 8b, Label Form — Stations and Calling Groups**:

1. Write the extension number for each telephone and calling group in the "Ext. No." column.
2. Write the label to be displayed in the "Label" column.

Posted Message

Posted Message allows users to post a message telling callers who have display telephones why they cannot answer.

There can be as many as 20 messages. The 10 messages shown on **Form 8c** are already programmed in the system. Ten others can be added, and the original 10 can be changed.

Posted messages can contain as many as 16 characters, including capital letters, numbers, ampersand (&), dash (-), space, colon (:), asterisk (*), and pound sign (#).

System Directory/ System Speed Dial

Planning Form Instructions

On Key System Form 8c, Label Form — Posted Message:

1. To add posted messages, write each new message next to its message number (11 through 20) in the "Label" column.
2. To change existing messages, cross out the message and write the new message in the "Revised Standard Message" column.

Users may dial certain numbers frequently, such as the numbers of clients, suppliers, or branch offices. You can assign and store up to 130 four-character System Speed Dial codes with a large processor module, and up to 40 with the small processor module. To call these numbers, users simply dial the 4-character codes—a pound [#] sign or the Feature button followed by three digits.

Assign System Speed Dial codes to telephone numbers that shouldn't be displayed on telephones, such as numbers that contain access codes. You can also assign labels to the System Speed Dial codes. These labels are listed in the System Directory so that MLX telephone users can search for them and dial System Speed Dial numbers with the touch of a button.

Planning Form Instructions

Review the analysis of question 9 on the **Employee Communication Survey**.

On Key System Form 8d, System Speed Dial and System Directory:

1. Check "No" in the "Display" column if you do not want the number displayed.
2. Write each telephone number in the "Telephone Number" column.
3. Write the label to be displayed for the number in the "Label" column.

Modifications

5

To modify the system:

- Decide what you want to change and identify the programming needed.
- Complete (or revise) the appropriate Key System Planning Forms.
- Program the modification using Chapter 3 of *System Programming*.

This chapter presents a series of steps, which describe

- the actions you must take to add to the system
- the interrelated options or features you should consider
- the forms that must be revised or completed

References to the relevant sections of this and other books, where detailed instructions can be found, are included.

Preparation

Collect your file of Key System Planning Forms. Although you may need to revise only one or two forms, it is suggested that you have all completed forms available for reference.

Note: If you need clean copies of the forms, see Appendix A of this book.

Before revising the Key System Forms, analyze and document the modification planned. As examples:

- If adding stations to your system, adjust your Floor Plan to show the location of the new telephones and the kind of equipment to be used.
- If activating a feature such as System Speed Dial, survey employees to identify the numbers that should be programmed into the Speed Dial file.

Review Chapter 1 for details on preparation for planning activities.

Adding to the System

Adding to the system is defined as increasing its capacity or capability. This increase may mean adding more or different kinds of lines, connecting auxiliary equipment, or installing more stations (telephones, consoles or tip/ring equipment).

Step 1

Determine the specific type of line, auxiliary equipment, or station to be added.

Use Table 5-1 to determine the type of line and/or station module needed to support what you plan to add.

Step 2

Locate **Key System Form 1, System Planning**. Review the completed "Control Unit Diagram" on the back of the form and determine if the module type needed is present.

- If the module is not in the control unit, skip to step 4.
- If the module type needed is already in the control unit, continue to step 3.

Step 3

Determine if there are jacks available on the module for the new line, auxiliary equipment, or station. Use **Key System Form 2a, System Numbering — Station Jacks**, or **Key System Form 2c, System Numbering — Line Jacks**, to identify jack availability.

- If there are sufficient jacks available on an existing module, plan to connect the added line, equipment, or station to them. Skip to step 5.
- If there aren't jacks available, continue to step 4.

Step 4

Plan the placement of the new module required to support the line, auxiliary equipment or station. Review the guidelines that follow and decide where the new module should be placed.

- The power supply module must be placed in the far left slot of each carrier.
- The processor module must be installed in slot 0 of the basic carrier.
- Line and/or station modules can be placed in any order in slots 1 through 17 (with two expansion carriers), with the following conditions:
 - Install the modules in each carrier from left to right with no empty slots between modules.
 - Place all 012 and 008 OPT modules in the same carrier whenever possible.
 - Group all 100D and tie modules together whenever possible.

Table 5-1 Required Line and/or Station Modules

	100 D	400 EM	400	400 GS/ LS/ TTR	800	008 OPT	800 GS/ LS	008	008 MLX	012	408	408 GS/ LS
Loop-start lines			✓	✓	✓		✓				✓	✓
Tie trunks		✓										
T1 facilities	✓											
Emulated Imp-start lines	✓											
Emulated ground-start lines	✓											
Emulated tie trunks	✓											
ISDN-PRI services	✓											
Remote Access		✓	✓	✓	✓	✓	✓			✓	✓	✓
Loudspeaker paging			✓	✓	✓		✓				✓	✓
Maintenance Alarm			✓	✓	✓		✓				✓	✓
Music-on-Hold			✓	✓	✓		✓				✓	✓
Digital/ISDN (MLX) direct-line console									✓			
Analog direct-line console								✓			✓	4
Digital/ISDN (MLX) telephone									✓			
Analog multiline telephone								✓			✓	4
Tip/ring equipment								✓	✓	✓	✓	✓
Off-premises telephone						✓			✓	✓		

Note:

- DS1 facilities configured for T1 operation provide 24 channels.
- If planning Remote Access, at least one module with touch-tone receivers must be installed.
- If you use equipment that rebroadcasts music or other copyrighted materials, you maybe required to obtain a copyright license from, and pay license fees to, a third party such as the American Society of Composers, Artists, and Producers (ASCAP) or Broadcast Music Incorporated (BMI). Or, you can purchase a Magic on Hold system, which does not require you to obtain such license, from AT&T or your authorized dealer.
- If analog multiline telephones require either Simultaneous Voice and Data or Voice Announce to Busy, two consecutive station jacks are required.
- If connecting tip/ring equipment to the 008 MLX module, an MFM is required.
- If connecting tip/ring equipment to the 008, 408, or 408 GS/LS modules, a GPA is required.

Placing additional modules in the control unit calls for a recalculation of unit loads. See *System Reference* for instructions.

- If the control unit has an available slot to the right, and the guidelines permit placement there, skip to step 5.
- If you must rearrange existing modules to accommodate the new one, skip to step 6.

Step 5

Revise or complete the required Key System Planning Form(s) according to the directions shown in Tables 5-2 through 5-4.

Table 5-2 Adding New Lines

See Chapter 3, "Line Connections" and "Line Options."

See Chapter 4, "Labeling."

See Chapter 3, "Line Assignment."

See Chapter 4, "Remote Call Forward."

If adding	Complete
New lines	
■ Loop-start	All columns of Form 2c, System Numbering — Line Jacks
■ DS1 facility	All columns of Form 2c, System Numbering — Line Jacks, and Form 3c, Outside Lines — DS1 Facility (100D Module)
■ Tie trunk	All columns of Form 2c, System Numbering — Line Jacks Form 3d, Outside Lines — Tie
	Consider revisions to outside lines forms:
	■ 3a, Remote Access
	Consider revisions to feature form:
	■ 8a, Label Form — Lines
	Button Diagram on appropriate copies of Forms 4a through 5b
	If personal line is assigned, consider Remote Call Forward

If making more additions to the system, continue to the Table 5-3. When planning is complete, continue to Chapter 3 of *System Programming*.

Table 5-3 Adding Auxiliary Equipment

See Chapter 3, "Line Jack Connections for Auxiliary Equipment."

If adding	Complete
Maintenance Alarm Music-on-Hold Loudspeaker Paging	Form 2c, System Numbering — Line Jacks

If making more additions to the system, continue to Table 5-4. When planning is complete, continue to Chapter 3 of *System Programming*.

Table 5-4 Adding New Stations

See Chapter 2, "Station Jack Connections" and, if appropriate, "System Numbering."

See Chapter 3, "Line Assignment and Chapter 4. 'Features.'"

If adding	Complete
<p>New stations</p>	<p>All columns of Form 2a, System Numbering — Station Jacks</p> <p>Copy of appropriate telephone Form 4a through 5b</p> <p>Consider revisions to:</p> <ul style="list-style-type: none"> ■ Group Assigned Features (Forms 6b through 6e) ■ Allowed and Disallowed List assignments (Forms 6g and 6h) ■ Night Service assignments (Forms 7a and 7b) ■ Station Labels (Form 8b) <p>If direct-line console, consider revisions to:</p> <ul style="list-style-type: none"> ■ Operator Features (Form 6a) ■ Extension Status assignment (Form 6f)

Continue to Chapter 3 of *System Programming*.

Step 6

If rearranging modules in the control unit, the numbering plan will revert to the factory-set two-digit plan. You must then reprogram the system:

1. Collect a clean set of Key System Planning Forms from Appendix A.
2. Locate the AT&T Equipment List, the local telephone company line information list, the Floor Plan, and the analysis of the Employee Communications Survey forms. If any of these materials has been revised, you should have both the original and revised versions available.
3. Work through this book, starting at Chapter 2.

Forms

This appendix contains one copy of the Employee Communication Survey form and one copy of all Key System Planning Forms.

The forms are in numerical order and organized according to planning purpose as shown below.

Table A-1 Key System Forms

Used for Planning	Form No.	Form Title
Features and Calling Privileges	N/A	Employee Communications Survey
Control Unit Assembly and Operating Conditions	1	System Planning
System Component Numbering	2a 2b 2c 2d 2e*	System Numbering — Station Jacks System Numbering — Digital/ISDN Station Adjuncts System Numbering — Line Jacks System Numbering — Special Renumbers Systems Technician's Run Sheet
Outside Line Connections	3a 3b 3c 3d	Outside Lines — Remote Access (Resewed for Hybrid/PBX) Outside Lines — DS1 Facility (100D Module) Outside Lines — Tie
Station Connections	4a 4b 4c 5a 5b	Analog Multiline Telephone Digital/ISDN (MLX) Telephone and MFM Adjunct Tip/Ring Equipment Direct-Line Console (DLC) — Analog Direct-Line Console (DLC) — Digital/ISDN and MFM Adjunct
Features for Operators	6a	Optional Operator Features

* Form 2e is used by installation personnel.

Table A-1 Continued

Used for Planning	Form No.	Form Title

Employee Communication Survey

Name _____ Room _____ Extension _____

Name of work group (Sales, Customer Service) _____

Please answer each question below.

1. Do you regularly use any of the following outside lines? (Check any that apply)

- WATS
- FX (foreign exchange)
- Tie
- None of the above or don't know

2. Are your phone calls covered when you're away from your desk?

- No
- Yes By whom? _____

3. Do you cover phone calls for co-workers when they are away from their desks?

- No
- Yes For whom? _____

Which of those people should have a button on your phone used exclusively for his or her calls?

When you are unable to cover calls, it is done by _____

4. Do you share the incoming call workload with others?

- No
- Yes With whom? _____

5. Would you say your phone use is

- Heavy
- Average
- Light

6. Do you have a data terminal or personal computer at your workstation?

- No Do you expect to get one within the next year?
 - No
 - Yes
- Yes Do you have a modem or ISDN 75006 Data Module?
 - No
 - Yes

7. Do you use account codes for charge-back of calls?

- No
- Yes Please list all the codes you use (attach another sheet if necessary):

8. Approximately how many times do you transfer calls? _____ times/day

9. Do you need to dial the same number over and over every day?

- No
- Yes Please list these numbers:

10. Do you want to be able to pick up other people's calls when you hear their phones ring?

- No
- Yes Please list these people:

11. Do you want your phone number to appear on another person's phone for screening, or covering calls, or for other reasons?

- No
- Yes Please list these people:

Key System Form 1

System Planning

Size of Processor Module

- Small — maximum 24 lines and/or 56 stations
 Large — maximum 80 lines and/or 144 stations

Capacity

Lines

Module Type	Number of Modules	Lines Supported by Module	Total Lines by Module Type
400	x	4	
800	x	8	
408	x	4	
400 GS/LS/TTR	x	4	
800 GS/LS	x	8	
408 GS/LS	x	4	
400EM	x	4	
100D	x	24*	
System Totals			

* The 100D module has one physical jack that supports 24 lines.

Stations

Module Type	Number of Modules	Physical Jacks per Module	Physical Jacks by Module Type	Station Extensions Assigned	Total Station Extensions Assigned
008 MLX	x	8	x	2	
008	x	8	x	1	
408	x	8	x	1	
408 GS/LS	x	8	x	1	
012	x	12	x	1	
008 OPT	x	8	+	(x 4)*	
System Totals					

* The 008 OPT module is assigned 12 extension numbers although there are only 8 physical station jacks.
