NOTICE

SpectraLink Corporation has prepared this document for use by SpectraLink personnel and clients. The drawings and specifications contained herein are the property of SpectraLink and shall be neither reproduced in whole or in part without the prior written approval of SpectraLink, nor be implied to grant any license to make, use, or sell equipment manufactured in accordance herewith.

SpectraLink reserves the right to make changes in specifications and other information contained in this document without prior notice, and the reader should in all cases consult SpectraLink to determine whether any such changes have been made.

The terms and conditions governing the sale of SpectraLink hardware products and the licensing of SpectraLink software consist solely of those set forth in the written contracts between SpectraLink and its customers. No representation or other affirmation of fact contained in this document including but not limited to statements regarding capacity, response-time performance, suitability for use, or performance of products described herein shall be deemed to be a warranty by SpectraLink for any purpose, or give rise to any liability of SpectraLink whatsoever.

In no event shall SpectraLink be liable for any incidental, indirect, special, or consequential damages whatsoever (including but not limited to lost profits) arising out of or related to this document, or the information contained in it, even if SpectraLink has been advised, knew, or should have known of the possibility of such damages.

Note concerning the Master Control Unit:

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

Note concerning shielded cable:

SpectraLink recommends the use of shielded cable for all external signal connections in order to maintain FCC Part 15 emissions requirements.

Note concerning the Wireless Telephone and Base Stations:

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

WARNING Changes or modifications to this equipment not approved by SpectraLink Corporation may cause this equipment to not comply with part 15 of the FCC rules and void the user's authority to operate this equipment.

WARNING SpectraLink products contain no user-serviceable parts inside. Refer servicing to qualified service personnel.

UL Information

This symbol on the nameplate means the product is listed by Underwriter's Laboratories, Inc. It is designed and manufactured to meet rigid U.L. safety standards against X-radiation, fire, casualty, and electrical hazards.

The following are statements required for UL certification, related to safety procedures that must be adhered to during installation.

Follow these general precautions while installing telephone equipment:

Never install telephone wiring during a lightning storm.

Never install telephone jacks in wet locations unless the jack is specifically designed for wet locations.

Never touch uninsulated telephone wires or terminals unless the telephone line has been disconnected at the network interface.

Use caution when installing or modifying telephone lines.

When installing Base Stations outside or in buildings other than the one containing the System Controller, take the following precaution:

If wiring for a Base Station exits a building—whether to reach an outdoor Base Station location or to reach a Base Station in another building—the wiring must be protected at both ends by a Quick Clip Fuse from Illinois Tool Works, Linx Division, model number SCP-2X2. The Quick Clip Fuse replaces the bridging clips on the 66 blocks for all four connections to the non-internal Base Station.

FCC Information

The Master Control Unit Complies with Part 68, FCC Rules FCC Registration Numbers: Link 3000: IYGUSA-7385Q-PX-T

Ringer Equivalence: Link 3000: 0.3B SpectraLink Corporation Link 3000 Made in the USA

This equipment complies with Part 68 of the FCC Rules. On the back of this equipment is a label that contains, among other information, the FCC Registration Number and Ringer Equivalence Number (REN) for this equipment. If requested, this information must be given to the telephone company.

This equipment uses RJ-21 connectors.

The REN is useful to determine the quantity of devices you may connect to your telephone line and still have all of those devices ring when your number is called. In most, but not all, areas, the sum of the RENs of all devices connected to one line should not exceed five (5.0). To be certain of the number of devices you may connect to your line, as determined by the REN, you should contact your local telephone company to determine the maximum REN for your calling area.

If your telephone equipment causes harm to the telephone network, the telephone service may discontinue your service temporarily. If possible, they will notify you in advance. But if advance notice isn't practical, you will be notified as soon as possible. You will be informed of your right to file a complaint with the FCC.

If you experience trouble with this telephone equipment, please contact SpectraLink Corporation for information on obtaining service or repairs.

SpectraLink Corporation 5755 Central Avenue Boulder, CO 80301 303-440-5330

The telephone company may ask that you disconnect this equipment from the network until the problem has been corrected or until you are sure that the equipment is not malfunctioning. There are no user serviceable parts in this equipment.

This equipment may not be used on coin service provided by the telephone company. Connection to party lines is subject to state tariffs.

Industry Canada (IC) Notice

Notice:

The Industry Canada (IC) label identifies certified equipment. This certification means that the equipment meets telecommunications network protective, operational, and safety requirements as prescribed in the appropriate Terminal Equipment Technical Requirements document(s). The department does not guarantee the equipment will operate to the user's satisfaction.

Before installing this equipment, users should ensure that it is permissible to be connected to the facilities of the local telecommunications company. The equipment must also be installed using an acceptable method of connection. The customer should be aware that compliance with the above conditions may not prevent degradation of service in some situations.

Repairs to certified equipment should be coordinated by a representative designated by the supplier. Any repairs or alterations made by a user to this equipment, or equipment malfunctions, may give the telecommunications company cause to request the user to disconnect the equipment.

Users should ensure for their own protection that the electrical ground connections of the power utility, telephone lines and internal metallic water pipe system, if present, are connected together. This precaution may be particularly important in rural areas.

Caution: Users should not attempt to make such connections themselves, but should contact the appropriate electric inspection authority, or electrician, as appropriate.

Notice: The Ringer Equivalence Number (REN) assigned to each terminal device provides as indication of the maximum number of terminals allowed to be connected to a telephone interface. The termination of an interface may consist of any combination of devices.

REN 0.3B Approval Numbers: Link 3000: 2128-9508 A

1. About This Document

This manual describes the installation procedure for the SpectraLink Link Wireless Telephone System (Link WTS) with a Link 3000 Master Control Unit (MCU). The procedures described in this manual are those that take place *after* the installation-planning procedure. You should already know the equipment requirements and installation locations. For example, you should know where each Base Station will be installed, and how many Interface Modules are required.

For more information, see *Link WTS – Link 3000 MCU: Installation* (Part Number 72-0059-01).

1.1 Contacting SpectraLink

SpectraLink wants every customer to have a successful installation. Please refer questions to our **Customer Support Hotline at (800) 775-5330.** The Hotline is open Monday through Friday, 7:00 AM to 6:00 PM Mountain Time.

1.2 Icons and Conventions

This manual uses the following icons and conventions.

Caution! Follow these instructions carefully to avoid danger.

Note these instructions carefully.

NORM

This typeface indicates a key, label, or button on the MCU or Wireless Telephone.

1.3 Installation Overview

Installation has three phases. In most cases, a separate person is responsible for each phase.

Site preparation and wire installation – usually done by a wire technician or contractor, with the assistance of a customer representative such as a project manager. Please refer to the *Facility Preparation* manual (PN 72-0059-05) for more information.

Installing the SpectraLink system – done by SpectraLink or one of our certified distributors.

Programming the customer's telephone system to work with the SpectraLink system –usually done by the customer's system administrator or technician. Please

refer to the *LinkPlus Interface Guide* for instructions on programming the telephone system at the local site.

Because these major steps require some parallel activities, it is important to coordinate the activities among the persons involved. The following table lists the installation steps and the person typically responsible for each step.

✓	Task Description	Wire Contractor or Electrician	Installer	Customer Project Mgr/ Sys Admin

2. Link Wireless Telephone System Description

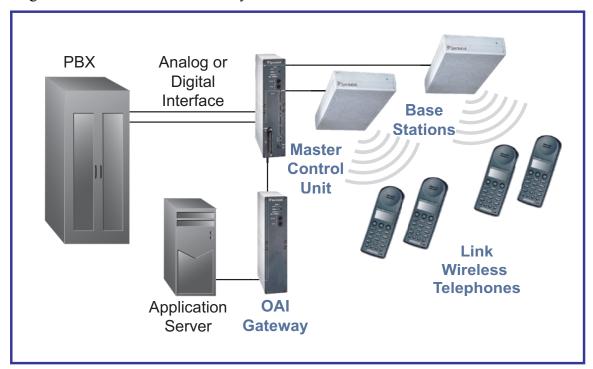

This section generally explains the installation and site requirements of the Link WTS. The Link WTS is a wireless communication system that allows hand-held Wireless Telephones to communicate using the existing telephone system.

The Link WTS's advanced micro-cellular architecture utilizes Base Stations, or cells, located throughout the facility to accommodate on-premises roaming. As a Wireless Telephone user moves within the coverage area the call is seamlessly passed between cells. The Link 3000 MCU supports up to 3,200 users and millions of square feet of coverage, resulting in a scalable enterprise-wide wireless voice solution.

For simplicity, this manual refers to the existing wired phone system, whether an on-premises PBX or Telco-provided Centrex system, as the "telephone system."

The Link WTS uses a micro-cellular design consisting of three primary components: the Master Control Unit (MCU), Base Stations, and Wireless Telephones. The following diagram shows an overview of the system.

Link Wireless Telephone System

2.1 The Master Control Unit

The Master Control Unit (MCU) is the processing center for calls to and from the Link WTS. It consists of at least one primary shelf (MCS300) and may have up to nineteen expansion shelves. Residing adjacent to the telephone switching equipment, the MCU operates as a standalone, external system while maintaining full PBX functionality for Wireless Telephone users.

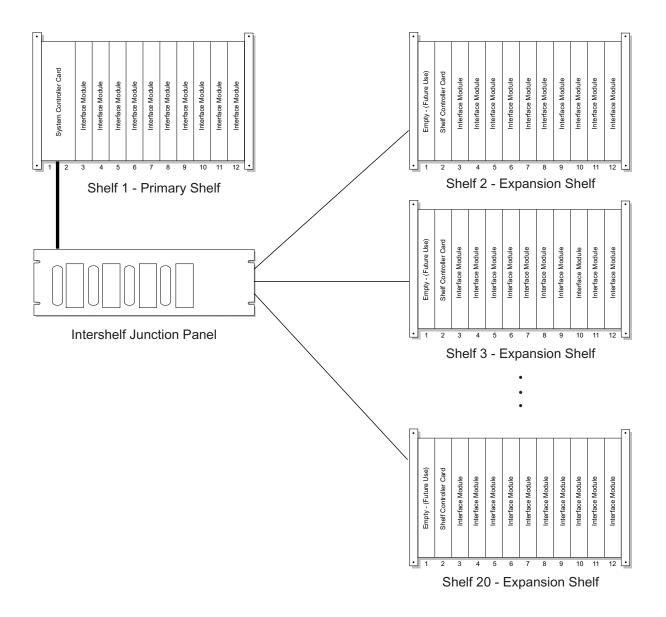

The MCU connects to the telephone system in two ways. The MCU can either interface with analog ports of the host telephone system or, in many cases, connect directly to the telephone system (PBX or key/hybrid system) via a digital interface. A digital interface provides the advantage that all switch features, such as call party name display and multiple line appearances, are preserved for the end user.

The MCU provides connectivity from the telephone switch to the wireless system components. Telephony ports for each Wireless Telephone are commissioned from the telephone switch. Base Stations, which provide the wireless link to the Wireless Telephones, are wired directly to the MCU.

The Link WTS Topology

Components in the Link WTS are designed in a star topology. At the center is the Link 3000 MCU. The primary shelf contains the system controller, which manages the call processing for the wireless network. Additional expansion shelf controllers manage intrashelf calling and work with the system controller to pass calls within the wireless network and to the telephony switch. All shelves provide universal slots for up to ten Interface Modules. Interface Modules connect Base Stations and Wireless Telephones to the system. Up to 20 shelves can be connected together to maximize the system capacity.

The following diagram illustrates a sample star topology for the Link WTS.

Link 3000 MCU - Star Topology

Shelf

Shelves are designed for 19 inch rack or wall mounting. Each shelf has 12 universal card slots. The first two slots are reserved for controller cards, the remaining ten slots are for Interface Modules. Wiring to each card is on the front panel. Power is -48V DC through the back or side panel.

System Controller (CSC or CSO301, 306, and 320)

Each system requires one system controller card, which occupies two slots (slot 1 and 2) in the main shelf. The system controller supports call routing within the entire system and to external ports. Each model number of System Controller (301, 306, and 320) supports a different number of expansion shelves. The CSO model System Controller supports Open Application Interface (OAI) enabled expansion shelves.

Two RS-232 serial ports are provided on the system controller. Serial ports can be used for multiple purposes, including local administration, remote administration and diagnostics (via modem), OAI applications and call detail recording. One standard 10-base T Ethernet port is also provided (for future use).

Expansion Shelf (CSC300, CSO300)

An Expansion Shelf Controller (CSC300) resides in slot 2 of each expansion shelf. The Expansion Shelf Controller manages intra-shelf traffic and communicates with the system controller. The CSO300 Expansion Shelf Controller supports an OAI enabled expansion shelf.

Part Numbers with a CSO prefix have the same functionality and capacity as the corresponding CSC Part Numbers and also support the Open Application Interface(OAI)

Interface Modules (CPA, CPU, CPM, CPP, CPF316)

Telephone line and Base Station connections are made to the Interface Module. Each card provides 16 line (Wireless Telephone) interfaces and six Base Station interfaces. Interface Modules are installed in slots 3 through 12 on a shelf. Interface modules include: Analog (CPA316), Universal (CPU316), Mitel interface (CPM316), four-wire digital (CPF316), and Panasonic (CPP316). The Interface Module type is defined via the Operator's Console and software when the card is installed. Interface Modules of different interface types can be mixed within a shelf.

Interface Modules are "hot swappable"; they can be removed and replaced without affecting service on the rest of the system.

Intershelf Junction Panel (JPI300)

The Intershelf Junction Panel (JPI300) connects Expansion Shelf Controllers on expansion shelves to the system controller, creating a completed communication channel between network elements. The Intershelf Junction Panel physically

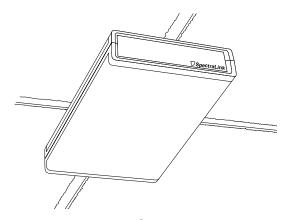

Page 15

connects the network, converting RJ-21 connections from the System Controller to the RJ-45 connection on the Shelf Controller.

2.2 Base Stations

Base Stations, or cells, provide the communication channel between the MCU and the Wireless Telephone. The Base Station and Wireless Telephone use digital spread spectrum radio transmission in the 902-928 MHz frequency band.

Each Base Station supports multiple users and covers a transmission area in excess of 50,000 square feet. The signal propagation is dependent on transmission obstructions within the building. A call is passed from one Base Station to another as the user walks throughout the coverage area. The Link WTS is designed to provide seamless coverage, enabling real-time hand-off of active calls.

Base Station

ccLink Wireless Telephone System

The ccLink Wireless Telephone System (ccLink WTS) is designed to meet the high simultaneous call capacity and advanced level of telephone feature integration of the call center environment. The ccLink WTS uses a special High Density Base Station which can be installed with minimal spacing (as little as 20 feet between Base Stations.)

2.3 Link Wireless Telephones

The Link Wireless Telephone is a durable wireless telephone that operates with all the functionality of a wired desk phone. Weighing only six ounces and ergonomically designed, the Wireless Telephone is comfortable and easy to use. The monolithic design of the Wireless Telephone, with no moving parts, will withstand a physically demanding work environment. The Wireless Telephone's alphanumeric display supports messaging from either the telephone switching equipment or an external data application. The Wireless Telephone provides up to four hours of talk time and 80 hours of standby between battery recharges.

When the Link WTS is connected to the telephone system using analog ports, the Wireless Telephone will provide many of the calling features of a desk phone, including transfer, conference calling, and hold. When the system is digitally interfaced to the phone system, the Wireless Telephone will also support the advanced features of the host telephone system such as calling party name display and multiple line appearances.

The Link Wireless Telephone

Each Wireless Telephone requires a line appearance (port) from the telephone system. Typically the Wireless Telephone extension number corresponds with the user's internal telephone extension number. On most switching systems the user's desk phone and the Wireless Telephone port can be bridged so that incoming calls ring both phones simultaneously.

2.4 Operator's Console

The system uses a proprietary software program for administration and maintenance. The software is loaded to the Operator's Console, an IBM-compatible personal computer, located close to the Link 3000 MCU. The PC is used to register each Wireless Telephone and Base Station, enter user information, monitor system operations, and initiate remote diagnostics.

3. Site Preparation

The following steps must be completed before installing the system hardware. If the steps are not already completed refer to each individual section for details. ☐ MCU location prepared. Typically the MCU is installed in the telephone equipment room. This location must have sufficient backboard space or rack space, and -48 volt power available. The correct number of cross-connect blocks (or equivalent) are installed and connected to a 25-pair Telco wire terminated with an RJ-21 male connector at the MCU location. The number of blocks required depends on the number and type of Interface Modules installed. Refer to 3.6 Prepare Demarc Blocks for more information. ☐ A two pair cable to each Base Station as designated on the building floor plans. ☐ The Base Station wiring is terminated with RJ-45 crimp-on plugs at the designated Base Station locations. Refer to 3.5 Terminate Cables at Base Station Locations for more information. ☐ The Base Station wire is terminated at the appropriate cross-connect demarc blocks. Refer to 3.9 Connect Cables from Base Stations and Phone Lines to Demarc Blocks. The analog or digital phone extensions from the phone system are terminated at the appropriate cross-connect demarc block and the block is labeled. Refer to 3.9 Connect Cables from Base Stations and Phone Lines to Demarc Blocks. ☐ A dedicated dial line is available with an RJ-11 jack for the diagnostic modem. ☐ An IBM-compatible PC is available to serve as the Operator's Console for system administration. A system administrator is designated for the SpectraLink system. This person should be present for the installation. The SpectraLink installer will provide system training to the system administrator on the day following the installation.

3.1 Required Materials Provided by Customer

Required Hardware

Rack - the shelves are designed to fit into a 19 inch mounting rack. Each shelf measures 15" high by 19" wide by 9" deep, and weighs approximately 35 pounds fully loaded.

Backboard space – as an alternative to rack mounting, the shelves can be wall mounted to ³/₄" plywood securely screwed to a wall.

Screws – required to mount the shelves to the wall, or to secure it in the rack. For wall mount, six #10-5/8" panhead wood screws (or similar device) are required. For rack mount, screws required are determined by the rack requirements; typically 10-32 or ½-20. For multi-shelf systems, four 1-3/4" #8 panhead wood screws are required to secure the Intershelf Junction Panel to the backboard, along with standoffs at least 1.5 inch long with ½" inside diameter.

Power and Conduit - 48V Power Source and conduit for connection, either ½" BX metallic or NMX conduit. Three #8 insulated rings for use with #14 AWG wire are required for each MCS300 to be installed.

25 Pair Cables – RJ-21 male at MCU end, required to connect the shelves to the cross-connect blocks.

Cross-Connect Blocks – required to connect the PBX ports and the Base Stations to the MCU.

Quick Clip Fuse – Required with an RCO-400 Outdoor Base Station or when a Base Station is located in a separate building from the Link 3000 MCU. Recommended Quick Clip Fuse is available from Reliable Electric, Model # RSCP-2.

Ladder - SpectraLink installation crew will require a ladder to reach the Base Station locations. Ensure that a ladder of adequate height is available for the crew's exclusive use upon arrival.

Operator's Console PC

cor	nform to the following specifications:
	An IBM-compatible personal computer, 486 or above (with a 16 MHz clock or faster)
	A hard disk with at least 2 Mbytes free space
	At least 640k bytes of RAM
	MS-DOS 3.2 (or later), or MS-Windows 95 (or above) or NT
	A 3 ½" floppy-disk drive (high density, 1.44 Mbytes)
	One RS-232 serial port for connection to the system controller
	emote access is required, the customer must supply an external modem, 9600 baud or ter.

A PC must be available to perform system administration and diagnostics The PC must

System Administrator

One person (or more, depending on the size of the system) must be designated as the system administrator for the Link WTS. This person is often also the company's telephone system administrator. This person should know the location of the company's current telephone equipment, have access to the telephone room, know the telephone system's feature codes, and should be present for the installation. If there is not currently a person carrying out such duties, someone must be designated as system administrator.

a large system. The system administrator should have access to the location of the SpectraLink system and be competent to perform the following functions:	
☐ Swap system components (Wireless Telephones, Base Stations)	
☐ Swap an Interface Module	
☐ Perform or direct basic moves, adds and changes to a telephone system	
☐ Perform or direct the receiving and shipping of components	
☐ Train users with video and handouts	
The system administrator should be available for training at the time of the SpectraLinl installation. The system administrator is given unlimited access to the SpectraLink 800 customer support line for additional assistance.	

The system administrator's tasks are minimal but may take up to two hours per week for

Union Labor

In some areas strict labor union rules will preclude the SpectraLink representative's ability to install the equipment without union assistance. If such rules are in force in the local area, the customer must ensure that sufficient union help is available at the scheduled installation time to carry out the following functions:

Install Base Stations

Move and reinstall Base Stations

Make cabling changes at cross-connect blocks

Run cables

Make and modify electrical connections

3.2 Prepare Location for Shelves

The MCU, composed of up to 20 shelves and one Intershelf Junction Panel, is usually installed in or near the telephone equipment room. If this is not possible, the MCU can be located anywhere that the telephone system lines are accessible.

The number and arrangement of the system shelves depends on the size and configuration of the system.

System Controller Part Number	Shelves Supported	Base Stations Supported	Users Supported
CSC301/ CSO301	1	60	160
CSC306/ CSO306	6	360	960
CSC320/ CSO320	20	1,000	3,200

Consideration should be given to:

☐ Environmental conditions. The system outputs 28 BTUs per hour, per interface module.

Space for the backboard or rack
Space for the shelves, which are designed for 19" rack or wall mounting.
Each shelf measures 15" high X 19" wide X 9" deep, and weighs approximately 35 pounds fully loaded.
Expansion shelves cannot be located more than 17 cable feet from the Primary Shelf.
All digital interface modules must be within 250 feet of the telephone system.
See your telephone system specifications for distance limitations for analog modules.
Location of the Intershelf Junction Panel (JPI300) adjacent to the shelves on a multishelf system.
The Primary Shelf containing the System Controller (CSC- or CSO306 or 320) must be mounted to allow connection to the JPI300 with a five-foot cable.
Expansion Shelves (CSC300 or CSO300) must be mounted to allow connection of the shelf to the JPI300 using 12 feet or less of cabling.
Space for the -48V power supply connections. Power supply conduit requires clearance of 1.5 inches on the rear or side of the shelves.
Maximum loop length specifications of the telephone system
Maximum wire distance from the MCU to a Base Station (6,000 feet)
Cabling for the Interface Modules and Controller cards. All cables (except power) are connected to the front face of the cards. Space is provided to route wiring to the back of the shelf.

Prepare Rack or Wall

The Link 3000 MCU can be mounted in a rack or on the wall. Rack or wall support must be adequate to support the number of shelves to be installed. Each fully loaded Link 3000 MCU shelf weighs approximately 35 pounds.

Rack Mounting

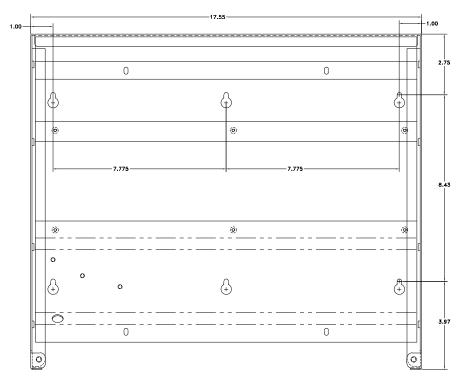

Before installing shelves in a rack, be sure the rack is mechanically fastened to the floor or wall such that it properly supports the number of shelves to be mounted. Follow the manufacturer's instructions to prepare the rack.

Be sure to leave 1.5" clearance at the rear of the racks for power conduit.

Wall Mounting

Before wall mounting, cover the wall with ³/₄" plywood. Secure the plywood to the wall studs every 16 inches with an adequate number of screws to support the number of shelves to be mounted. Each fully loaded shelf weighs approximately 35 pounds. Be sure to leave 1.5" clearance on the left side for power conduit.

Using the following drawing as a guide, drill six pilot holes using a 1/8" drill bit. Insert the six screws (#10 panhead wood screws, 5/8 inch long) into the pilot holes and tighten them, leaving approximately 1/8 to ½ inch gap from the wall.

Wall Mounting Dimensions

3.3 Prepare Power for Shelves

The Link 3000 MCU requires a –48V DC power source. The –48V connection is comprised of three wires: -48, +48 (neutral), and ground.

SpectraLink recommends that a licensed electrician install the –48V power source. It must be installed according to current National Electrical Code or National Fire Protection Code standards, in accordance with all local and municipal electrical code recommendations

Use of 14 AWG wire is recommended.

When connecting the -48 V DC system to power, note the following precautions:

A 30 amp circuit breaker must be present on the non-grounded DC circuit conductor, and the installer must ensure that means are provided for connection of the equipment to the DC source by permanent wiring methods, and no disconnecting device is located in the grounded DC circuit conductor between the point of connection to the supply and the point of connection to the grounding electrode and equipment grounding conductors.

3.4 Run Cables to Base Station Locations

The Base Station locations should be designated on the building floor plans provided to the installer. Base Stations can be mounted easily on raised or acoustical ceiling tiles, or on the wall. Avoid locating Base Stations in high or hard-to-reach places, as this will hinder maintenance, testing, or repositioning.

Wire Specifications

The customer's wire contractor is responsible for adhering to all local codes for wiring.

SpectraLink recommends UL-Listed Wire that conforms to the following specifications for AWG, distance, and number of power pairs required for this installation.

Power Pairs	Max Cable Feet 22 AWG	Max Cable Feet 24 AWG	Max Cable Feet 26 AWG
1	6,000	3,800	2,400
2	N/A	6,000	4,800
3	N/A	N/A	6,000

One additional pair is also required for Data.

For wire runs of less than 3,500 feet, attenuation must not exceed 6.8 dB/1,000 feet @ 772KHz.

For wire runs between 3,500 and 6,000 feet, attenuation must not exceed 4.5 dB/1,000 feet @ 772KHz.

Wire that is already installed (spare house cable) can be used when it is available. House cable will usually run from the MDF in the telephone equipment room to Intermediate Distribution Frames (IDFs) spread throughout the facility. Install new wire from the closest IDF to the Base Station. Be sure no bridge taps, multiples, or "Y" connections are created or present.

Determine the amount of wire needed to connect the Base Station to the MCU by scaling from a floor plan or a sketch, pacing, measuring, or estimating. Remember to include enough wire to reach the ceiling.

The wire length between the MCU and each Base Station may not exceed 6,000 cable feet.

Install an extra 25 feet of wire at the Base Station to allow for possible relocation.

Pull Cable

Pull the cable from the MCU location (usually in the telephone equipment room) to the Base Station locations designated on the floor plans.

If the cabling exits the building, refer to **5.3 Install Outdoor Base Stations**.

Run all cable before attaching the RJ-45 connectors to the Base Stations. Label both the demarcation block end and the Base Station end of each wire with the Base Station number using a wire tie marker or other form of marker.

Remove bridge taps, multiples, or "Y" connections to the Base Station wires; these will cause data transmission errors. When using IDFs be sure that the total wire length from the MCU to each Base Station does not exceed **6,000 cable feet**.

The area above some suspended ceilings is used as an environmental air plenum. The National Electric Code requires that wire that is installed in plenums be rated for plenum installation.

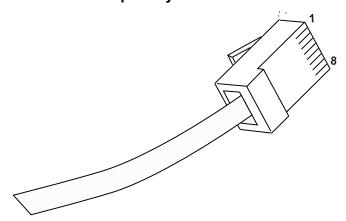

3.5 Terminate Cables at Base Station Locations

Terminate cable at the Base Station using an RJ-45 modular crimp-on plug.

To avoid damage to the connectors or crimps, be sure to run the wire to the Base Station before connecting the RJ-45 connectors.

After running the wire to the Base Station location, terminate the wire using an RJ-45 modular crimp-on plug. Connect the data pair to pins 1 and 2 and the power pair to pins 7 and 8. **These connections are not polarity sensitive.**

RJ-45 Modular Cable

Page 24

When wiring multiple power pairs, use the following table as a guide.

Pair	Function	Pin #s
1	Data	1,2
2	PWR 1	7,8
3	PWR 2	4,5
4	PWR 3	6,3

Power pairs are polarity sensitive; pins 7,4, and 6 must be the same polarity.

3.6 Prepare Demarc Blocks

Interface Modules are designed to operate with a specific interface to the telephone system: two wire digital or analog, or four wire digital (future release). The number of demarcation blocks required for the system depends on the number and type of Interface Modules to be installed

Interface Type	Interface Module Part Number	Wire Pairs	# Blocks
Analog POTS	CPA316	1	1
Universal (Comdial, DEFINITY, Meridian 1, Norstar, Rolm)	CPU316	1	1
Four Wire Digital	CPF316	2	2
Mitel (DNIC)	CPM316	1	1
Panasonic	CPP316	1	1

The CPU316 and CPM316 Interface Modules are intended only for connection to the isolated-side of an on-premises PBX. These interfaces are intended to connect to digital PBX ports that provide signals of 5Vp-p (max) AC component and some PBXs providing a 48Vdc offset.

Base Station wiring is the same for all Interface Modules.

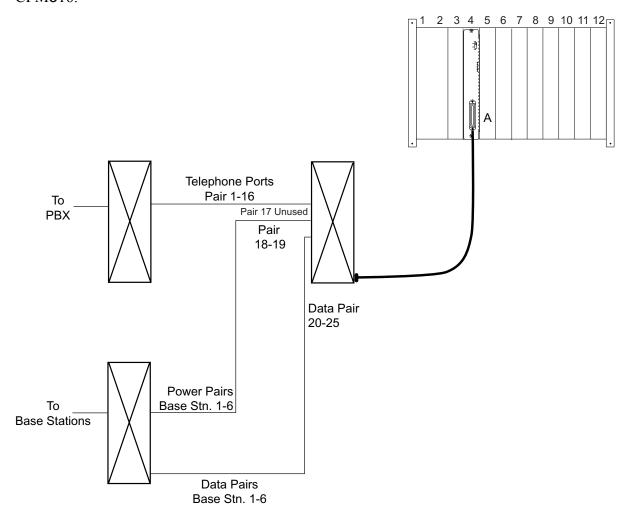

Based on the number and type of interfaces in the system, determine the number of 25-pair cables required to connect line ports and Base Stations to the demarcation blocks. The diagrams which follow provide an overview of the connections.

Multiple Power Pairs

Some sites may prefer to wire Base Stations to a separate demarc block in order to split out power pairs.

Two Wire Analog or Digital Interface

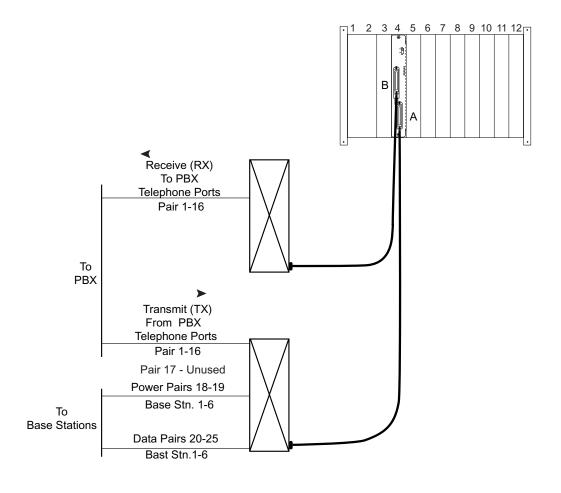

The wiring diagram below shows the connections required for a two-wire analog or digital interface. The Interface Module can be a CPA316, CPU316, CPP316, or CPM316.

Two Wire Analog or Digital Connection

Four Wire Digital Interface

The wiring diagram below shows the connections required for a four-wire interface (CPF316). Each Interface Module of this type requires two backboards which will be wired as indicated.

3.7 Install Demarc Blocks

The demarcation blocks used to connect the telephone system and Base Stations to the MCU should be installed on a typical telephone facility backboard. A ½" or ¾" thick board mounted on the wall near the MCU is typical. Although this manual uses 66-blocks as examples, any standard cross-connect blocks are acceptable.

If the wiring between the MCS300 and the telephone system leaves the building, consult the telephone system manual, the NEC, and local codes for instructions on providing lightning and other over-current protection.

3.8 Program Telephone System

Plan Location of Lines and Base Stations on Interface Modules

Each Interface Module can support 16 Wireless Telephones and six Base Stations. Consider the usage and traffic patterns at this site in determining the placement of lines and Base Stations on each Interface Module. To obtain maximum calling capacity, locate Wireless Telephones and Base Stations which will be used by those Wireless Telephones on the same shelf.

Interface Modules of different interface types may be mixed within a shelf. However, within a given Interface Module, all ports must interface to the same type of telephone system.

Assign and Program Ports

The wire contractor should inform the system administrator which port numbers have been designated for the Wireless Telephones and the remote diagnostics modem line.

The system administrator must assign extension numbers to the Wireless Telephones and plan the functions (trunk access, toll restrictions, system features, ringing options etc.) to be programmed for the Wireless Telephones. This programming will be done after the Wireless Telephones are registered, but will be faster if it is planned in advance by verifying the parameters and features on the current telephone system and wired phones.

For details, refer to *LinkPlus Interface Guide* for the type of telephone system for the system controller in use.

3.9 Connect Cables from Base Stations and Phone Lines to Demarc Blocks

Two-pair twisted cable from Base Stations installed throughout the facility converge at the demarc block or backboard. Each Interface Module can support six Base Stations and 16 Wireless Telephones. The Base Station and Wireless Telephone cables are punched down onto the Interface Module cross-connect blocks as shown in the demarc block diagrams below.

Photocopy the Base Station Location Form and Extension Assignments Worksheets (7.1 and 7.3) as needed. Use the forms to track the Base Stations and Wireless Telephone port assignments connected to each Interface Module. As the installer punches down each Base Station or Wireless Telephone connection, fill in the information on the form to identify the position of the Base Station or Wireless Telephone (the building and floor number, for example) and a detailed description of the location (perhaps a room number). A copy of this form should be posted near the cross-connect block.

Up to six Base Stations can be connected on a single Interface Module. Each Base Station uses two pair; one for data and one for power, so 12 pairs will be used to wire six Base Stations.

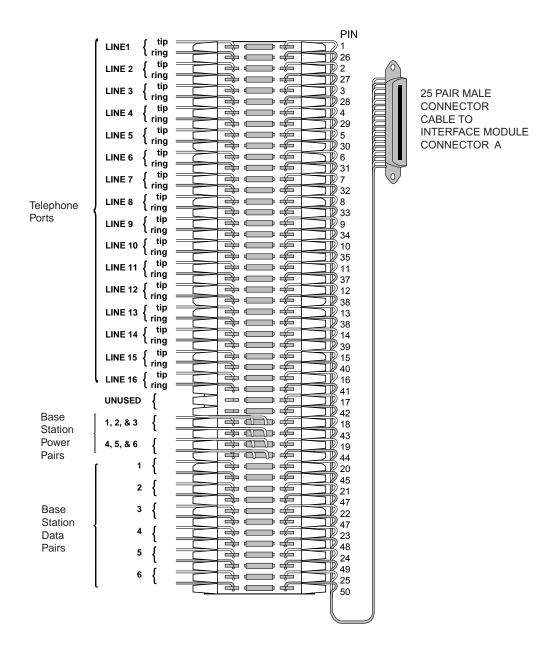

When wiring an external Base Station or a Base Station with wiring that exits the building, protect all Base Station wiring with the Quick Clip Fuse (Reliable Electric RSCP-2) before bridging with other Base Station power leads.

If the wiring between the MCS300 and the telephone system leaves the building, consult the telephone system manual, the NEC, and local codes for instructions on providing lightning and other over-current protection.

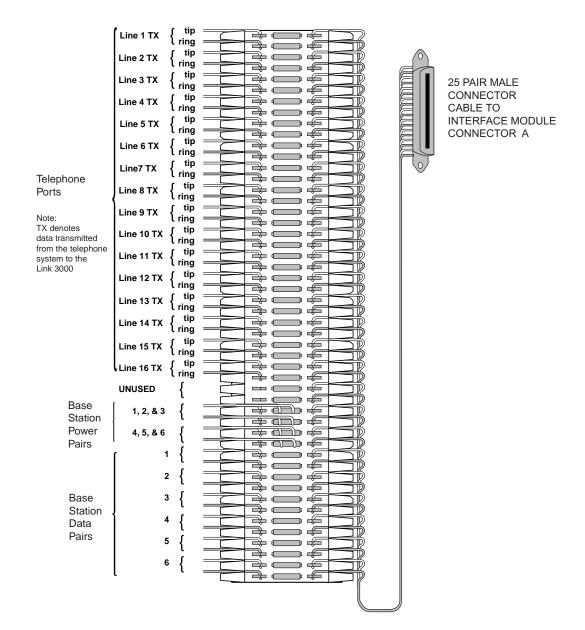

Two Wire Analog or Digital Demarc Block

The demarc block for the two-wire analog or digital interface should be wired as follows:

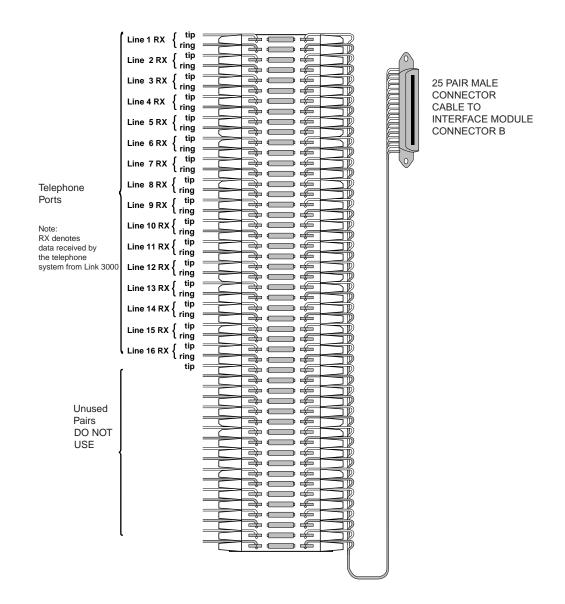

Four Wire Digital Demarc Block

The four wire digital interface (future release) requires two demarc blocks, one to Connector A and one to Connector B on the Interface Module. They should be wired as follows:

Four wire digital - Connector A

Four wire digital - Connector B

Connect Demarc Block 25-Pair Cable

In some installations the demarc block is connected to the Interface Module using a 25-pair Telco cable with **one male** and **one female** RJ-21 connector. The female connector is plugged into the right side of each cross-connect block. The male connector from each cable will be connected later to the front of the Interface Module.

Be sure to use only cables that are UL-listed communications circuit accessories. Only 24 of the 25 pairs are used in the Interface Module cable.

4. Connect Power to Shelves

SpectraLink recommends that a licensed electrician install the –48V DC power supply.

When connecting the -48 VDC system to power, note the following precautions:

A 30 amp circuit breaker must be present on the non-grounded DC circuit conductor, and the installer must ensure that means are provided for connection of the equipment to the DC source by permanent wiring methods, and no disconnecting device is located in the grounded DC circuit conductor between the point of connection to the supply and the point of connection to the grounding electrode and equipment grounding conductors.

The DC input to the power supply is polarity sensitive. Incorrect hookup will prevent normal operation of the system and may cause damage. Double check polarities before making any connections. Verify that the DC power switch on the shelf is off.

4.1 Run Conduit To Shelf

The shelves have two possible points of entry for conduit: on the side, used for wall mounted shelves, or in the rear, used for rack mounted shelves.

Select the point of entry (side or rear) for this installation and unplug the correct opening on each shelf to be installed.

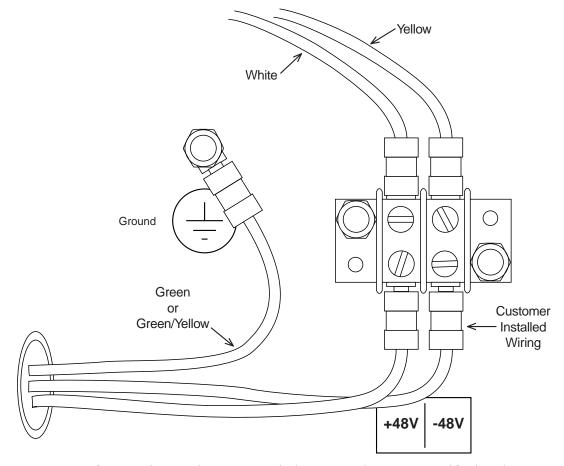

For each shelf:

Attach the conduit entry hardware (condulet) to the conduit.

Pull the conduit through the hole.

4.2 Connect Wire to Terminals

Connect the wire to the terminal strip and grounding stud, as shown in the following illustration. Position the wires to be flat against the back of the shelf.

Before turning on the power switch, use a voltmeter to verify that the terminal labeled -48V is negative with respect to the terminal labeled +48V.

5. Install Base Stations

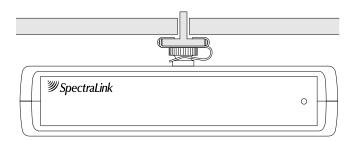

Be sure the Base Station is positioned clear of anything that might damage it. The Base Station should be well above head height, away from doors and other objects that might strike it, and away from areas open to the elements or possible water leaks.

Check the location for other radio antenna devices and place the Base Stations to avoid interference. Leave enough slack wire to account for possible future Base Station moves.

5.1 Mount Base Stations on Dropped Tile Ceilings

A ceiling clip and plastic bolt are supplied to install Base Stations on the drop ceiling rails (T-bars) used to support acoustical tile. The plastic bolt screws into the top of the Base Station, then snaps into the ceiling clip which has been attached to the rails that hold the acoustical tile. The fastener is designed for use on 15/16" wide rails.

- 1. Attach the metal fastener to the rail (T-bar) supporting the dropped ceiling by rotating it into position until it snaps into the locked position.
- 2. Screw the plastic bolt to the $1/4 \times 20$ captive nut into the top of the Base Station.
- 3. Slide the bolt into the exposed prongs of the metal clip until it snaps into position.
- 4. When properly attached the Base Station should sit almost flush against the ceiling and be tightly attached to the clip and T-bar grid work.

5. Once the Base Station is anchored to the fastener, lift the acoustical tile and plug the RJ-45 8-pin modular plug into the connector on the top of the Base Station.

The LED will blink red and green as the system software downloads to the Base Station and the Base Station is tested.

When the LED blinks amber, the system is ready for operation.

When the LED blinks green, a Wireless Telephone has established a radio link with that Base Station.

If the LED turns solid red or other red/green sequence, refer to *Link WTS Maintenance and Diagnostics* (72-0059-04).

5.2 Mount Base Stations On Finished Ceilings

If this site does not have a dropped tile ceiling, the Base Station can be mounted to a finished ceiling or wall with a 4-5" long 1/4" –20 TPI plastic or nylon screw or bolt (such as a lag screw).

The customer's wire contractor is responsible for this installation.

- 1. Drill two holes approximately one inch apart. Make the holes large enough to accommodate the RJ-45 connector and a bolt to secure the Base Station.
- 2. Insert a wide washer above the ceiling, then screw the bolt into the beam or ceiling.
- 3. Insert three nuts on the bolt, then screw the Base Station into the bolt, being careful not to insert the bolt more than 1/3 inch, five full turns, into the Base Station.

If the ceiling is open with I-beams or pipe construction, mount the Base Station with I-beam clamps or pipe clamps.

5.3 Install Outdoor Base Stations

Outdoor Base Stations (RCO-400) are equipped with a protective enclosure, designed to be mounted to a wall or pole. After the enclosure is mounted, the Base Station is inserted in the enclosure and connected.

The customer's wire contractor is responsible for wiring and mounting the outdoor Base Station enclosure. The contractor is responsible for supplying screws, brackets, and other appropriate hardware.

If the wiring between the MCS300 and the telephone system leaves the building, consult the telephone system manual, the NEC, and local codes for instructions on providing lightning and other over-current protection.

Wire Outdoor Base Stations

If the wiring for a Base Station exits a building—whether to reach an outdoor Base Station location or to reach a Base Station in another building—it should be equipped with primary protection according to the National Electric Code (NEC) and/or local codes.

Wiring that exits the building must also be protected at both ends by a Quick Clip Fuse from Reliable Electric, part number RSCP-2. Insert the Quick Clip fuses in place of bridging clips on a 66 Block for the non-internal Base Station circuits.

Mount and Connect Outdoor Base Stations

- 1. Mount the outdoor Base Station enclosure to a wall or pole. The enclosure should be attached at the highest point available that will provide central coverage for the outdoor area.
- 2. Insert the Base Station wire through the compression fitting and tighten the fitting.
- 3. Wire the Base Station connector the same way as the RJ-45 connectors for the indoor Base Stations.
- 4. Place the Base Station inside the enclosure with the part number label facing the back of the enclosure.
- 5. Screw the protective cover onto the Base Station enclosure.

5.4 Power Up and Check Diagnostics

Turn the power switch in the upper left of the Primary and Expansion Shelves ON.

After a slight delay, the lights on the cards will cycle through diagnostic tests.

After testing completes, lamp 1 should flash green, indicating that the card is running. If the Alarm light is red, there is a problem with the system. Refer to *Link WTS—Link 3000 MCU: Maintenance and Diagnostics (72-0059-04)* for troubleshooting information.

6. Sample Schedule for On-site Installation by SpectraLink Engineer

This schedule assumes that the facility has been completely prepared for the installation and that all Base Station mounting is the SpectraLink standard. For larger installations (greater than 18 Base Stations) the schedule may be lengthened.

Day 1

The SpectraLink engineer will install the system and train and administrator. Our engineer will usually be on-site from 9:00 AM to 5:00 PM. Activities will include the following:

When the SpectraLink Installer arrives on-site he/she will:

- 1. Survey site for installation.
- 2. Inventories equipment.
- 3. Set up MCU and verifies operation.
- 4. Register, label, and verifies operation of all Wireless Telephones.
- 5. Programs any feature codes required.
- 6. Installs Base Stations and verifies operation.
- 7. Tests coverage of system and makes any adjustments.
- 8. Install and verifies modem connection.
- 9. Provide system administrator with coverage map.
- 10. Walk the site with the system administrator to show coverage.
- 11. Trains a system administrator.

Note: SpectraLink standard mounting is on 7/8" T-bar grid or on 3/4" steel beams. All areas must be accessible with standard on-site equipment. All other non-standard or non-accessible mounting of the base stations should be completed by the customer prior to the installation of the rest of the system.

Day 2

The SpectraLink engineer will assist with training of the end-user and verify that all questions are answered. Our engineer will usually be on-site from 9:00 AM to 3:00 PM. Activities will include the following:

- 1. Assists with hand out and training of Wireless Telephone users.
- 2. Remain on site for a couple hours to answer any questions from users/administrator.
- 3. Has customer contact/System Administrator sign the installation acceptance document.

7. Installation Forms

This section contains the following forms:
☐ Site Preparation Checklist
☐ Base Station Locations
☐ Extension Assignments
Copy these forms as needed. Be sure to maintain completed forms for future reference.

7.1 Site Preparation Checklist

If upon arrival the SpectraLink installer determines that the pre-installation work has not been completed correctly, the installer has two options: 1) the installer can leave the site and reschedule the installation when the action items have been completed or corrected, or 2) the installer can assist in preparing the site, and thus spend additional time in the installation of the system. Because of the additional cost incurred by SpectraLink in executing either option, the customer will be billed for the additional time at our standard hourly rate plus expenses.

	ase review the Facility Preparation Manual and make sure the following items are upleted:
	MCU location prepared. Typically the MCU is installed in the telephone equipment room. This location must have sufficient rack backboard space and power available. See sections 2.3 for further details.
	Two-pair wires are run to each of the Base Station locations as designated on the building floorplans. Use Level 3 cable for lengths up to 3,500'; Level 4 for lengths up to 6,000'.
	The Base Station cables are terminated with RJ-45 crimp-on plugs at the designated locations. See section 2.6.
	One (or two) cross-connect block(s) are installed for every Interface Module and connected with a 25-pair telco cable terminated with an RJ-21 male connector at the MCU location as shown in section 2.7 and 2.8 .
	The Base Station cables are terminated at the appropriate cross-connect blocks. See section 2.10.
	Analog or digital ports, one per Wireless Telephone, from the switch is terminated at the appropriate cross-connect block and the block is labeled with the extensions. See section 2.10.
	A dedicated dial line (MB) is available with an RJ-11 jack for the diagnostic modem.
	An IBM-compatible PC is available to serve as the Operator's Console for system administration. See section 1.4.
	A system administrator is designated for the Link WTS. This person should be present for the installation. The SpectraLink installer will provide system training to the system administrator on the day following the installation.
	nen this checklist is completed please sign, date, and fax to: stall Coordination 303-449-7016)
Sig	nature: Date:
Spe	you have any questions regarding the installation procedure, please call the ectraLink Customer Support Hotline at 800 775-5330 (Monday through Friday, 7 AM 6 PM MDT).

7.2 Base Station Location Form

Shelf Number: _____ Interface Module: _____

Base Station #	Location (e.g.: building, floor #, detailed description)	Interface Module Circuit #
Base Station 1		1
Base Station 2		2
Base Station 3		3
Base Station 4		4
Base Station 5		5
Base Station 6		6

Shelf Number: _____ Interface Module: _____
